SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$15.
Durgen, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caney Ledge, \$25.
King Charles, at Flowery, \$6.
Edgar Co., Great Western Ledge, Gelena, \$20.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.
[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE FULLY informed that their NEW BILLIARD SALOON, with EIGHT CLASS PHELAN'S TABLES, will be opened for business on SATURDAY 29th, 1861. The undersigned respectfully solicits the patronage of TIERNEN Billiard Players, and hope by conducting their Saloon in an unusual manner, to merit their continuance and support.

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, and more and Tweed Suits, etc., from materials made at the Mission Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on the machine is not surpassed.

Various styles of Machines have been employed on the above materials but the Wheeler & Wilson is preferred.

PURE NATIVE SONOMA WINES.

RED, WHITE, AND SPARKLING.

From Lachryma Montis Vineyard.

NY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage last five years, I have determined on introducing them into the market which purpose I have appointed A. S. Lowndes & Co. my sole agents, from the wines may be obtained in their pure state, as they come from the vine in Sonoma. M. G. VALLEJO, the depot, 617 Montgomery street, from this time we shall have in a constant supply of all classes of the Lachryma Montis Wines, and a purchasing room as may rely on obtaining the pure offspring of the First Premiums and Diplomas have been awarded to Gen. Vallejo, specimens of his Wines exhibited at the various Fairs held in the different States during the past four years, and having now attained age, are for the first time brought into market. As dinner wines, and are healthy beverage for this climate, the Lachryma Montis Wines will be surpassed. For sale in quantities to suit by A. S. LOWNDES & CO., Agents, Montgomery street, opposite Montgomery Block, San Francisco.

LIFORNIA LLOYD'S—MARINE INSURANCES.—Office, Southwest corner of Washington and Battery streets. PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains. We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Mills and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Milling Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at McCall's mill in this city. Knox's Amalgamator, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smit Mills; Roller Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Opbri Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE, AND PECULIAR ADVANTAGES WHICH THIS MACHINE CAN OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing. KNAIP, BURRELL & CO.,
ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munn & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interests of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

On the Formation of Minerals in the Humid Way.

In a communication on the above subject recently made to the Boston Society of Natural History, by Dr. C. T. Jackson, he remarked of chemical springs that they are generally found along the line of disruption of strata of rocks, and near the junction of eruptive rocks with those of aqueous disposition. In the Vosges, it is at the line of contact of granite and the new red sandstone that the hot springs of Plombières are found. The waters of these springs have a temperature of seventy-three degrees Centigrade, or one hundred and sixty-three degrees Fahrenheit. These waters contain 0.03 grammes of silicate of potash per litre. Ancient Roman baths were found at these springs, and the river had been turned out of its natural channel into an artificial one, in order to accommodate the construction of the baths. In these ancient works were found bronze stopcocks, in which the bronze was changed into gray sulphuret of copper. In the bricks of the Roman works, numerous crystals of zeolite minerals were found, which had been formed in the cavities by the action of the mineral waters; also small crystals of fluor spar. Among the minerals thus formed are Apophyllite, Chabasie, Chalcedony, Malachite, Hamatite, Opal, Hyalite, Arragonite, Calcareous Spar, and a variety of other minerals. The alkaline mineral waters acting on the components of the bricks and cement formed double silicates most readily. The Apophyllite was found in the cement, and not in the bricks, while Chabasie was found in the bricks.

The conditions required for the formation of zeolite minerals are fulfilled most perfectly when trap rocks are thrown in a molten state into beds of new red sandstone strata. The humid sandstone and slates of that series are in the very condition required for the chemical combinations to take place, under the heat of the trap rocks and the influence of heated saline waters. Trap breccia is a mixture of scoriaceous trap rock and sandstone. Amygdaloid is the scoria produced by the interfusion of trap rocks and sandstone. Now, in Nova Scotia, all along the shores of the Bay of Fundy, we find in the utmost profusion the Zeolites, Quartz and Amethyst geodes, Apophyllite, Stilbite, Mesotype, Analcime Agates, etc., in the Amygdaloid, but not in the comacott trap rocks. So on the south shore of Lake Superior, where the trap rocks have been erupted through and between the strata of new red sandstone, we find the Amygdaloid at the point of contact of the trap and the sandstone, and the Amygdaloid is filled with an abundance of Zeolite minerals, Agates, Chalcedony, etc., while the compact trap rocks are not charged with these minerals. Dr. Jackson therefore inferred that these minerals were produced in the Amygdaloid by agencies such as are cited by M. Daubree.

Sea-water undoubtedly played a conspicuous part in effecting changes in the composition of rocks, and in the formation of minerals contained in the metamorphosed rocks; and it is probable, in accordance with the views of Forchammer, Mitscherlich, Marignac, Senarmont, Favre and Hunt, that the magnesia of the Dolomites came from the decomposition of the chloride of magnesium of sea-water, and that gypsum was also produced by the reaction of the sulphate of soda on the carbonate of lime. Forchammer found that when sea-water was heated with bicarbonate of lime magnesia was precipitated, and the proportion augmented at higher temperatures under pressure. He found also that gypsum was decomposed in fourteen days when in contact with carbonate of magnesia, and sulphate of magnesia and carbonate of lime resulted. Marignac found at two hundred degrees Centigrade that chloride of magnesium and carbonate of lime, reacted on each other, and that double carbonate of magnesia resulted. Senarmont made a similar experiment. Favre estimates that an ocean pressure of from five hundred to six hundred feet is adequate to effect these changes when the water is heated.

POPULATION OF NEVADA TERRITORY.—Dr. Degroot, Census Marshal for Nevada Territory, says the Enterprise, having received all the returns from his deputies, presented his report to the Governor on Monday last. The labor of taking the census has been an arduous, only eight days being allowed for that purpose. In addition to the enumeration of the inhabitants, quite an amount of statistical information has been collected. The entire population of the Territory, including Esmeralda and Honey Lake, is 16,374. Annexed is a list of the different and their respective populations:

First District—Including all of Carson Valley south of Clear Creek.....1,057

Second District—Carson City, including Eagle Valley, and that portion of Carson Valley north of Clear Creek, and to a point three miles south of Nevada City.....2,076

Third District—Nevada city and vicinity.....628

Fourth District—Silver City and vicinity.....1,022

Fifth District—Gold Hill and vicinity.....1,297

Sixth District—Virginia City and Flouery District...3,284

Seventh District—Washoe Valley, including all the territory south of the divide between Washoe Valley and Steamboat Creek.....1,005

Eighth District—Washoe Valley and Steamboat Creek.....608

Ninth District—Including Honey Lake Valley and all the territory north of Truckee Valley, from a point where the Truckee river enters the mountains below Gates & Yarges', and west of Pyramid Lake.....1,073

Tenth District—Humboldt City and County, including the Valley of the Humbolt and Silver Hill District.....469

Eleventh District—Fort Churchill District, including Carson Valley from a point 10 miles below Nevada City to the Sink of the Carson.....569

Twelfth District—Walker River Valley, and all the territory south and east of it.....3,236

CHEAP SALE.—The Bactrian camels were sold the other day in this city at the rate of two hundred dollars apiece. A train of them will soon be engaged in packing between Placerville and Virginia City, across the Sierra Nevada.

The governmental expenditures of Great Britain are £215,000, more than a million of dollars per day. The people consume seven hundred thousand dollars of food per day, more than their soil produces.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR: VOLUME III.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of every thing generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers! This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

A. W. VON SCHMIDT, Chief Engineer

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, AUGUST 31, 1861.

NO 23.

FROM OUR TRAVELING CORRESPONDENT.

NEVADA August 24th, 1861.

To the editor of the MINING AND SCIENTIFIC PRESS.—Sir.—I herewith furnish you a few facts relative to the quartz mining interest of this county.

The Nevada Quartz Mining Company have a mill on Deer Creek, known as Sagg's Mill, employing forty men who are taking out eighteen and twenty tons of rock a day, and crushing the same. The average yield for the last three years has been nineteen dollars per ton, though at times it has yielded thirty eight dollars per ton. The rock is hard and firm, being what is called a Sulphuret Ledge, with but little or no free gold. In this mill they are running twelve stamps of eight hundred pounds each, two sets of Jinny's Mills and a Baukam Patent Amalgamator, together with eight of Bradford's Patent Separators. The whole is driven by an Over Shot Wheel, thirty-one feet four inches in diameter—five feet four inches breast. They are also using Stanford's Patent Feeder, of which they speak in high terms. Their sulphurets, which heretofore were lost, are now sold at one hundred dollars per ton, and are said to yield twice that amount when properly worked.

The Gold Mill Mill, Grass Valley, Messrs. Atwood Walsh and Martinican, proprietors, established 1853, have an engine of eighty horse power, running twenty-one stamps of 750 pounds each, and five Chile Mills, capable of crushing thirty tons of the hardest rock per day (twenty-four hours). This is a Custom Mill, crushing for other parties at from two dollars to six dollars per ton, according to the quality. There is now rock from ten companies lying at the mills. They can crush and keep separate for four companies at a time, and have rock on hand for the next three months at from thirty to fifty tons per day.

Two hundred tons of quartz from the lead of Messrs. Scaddan & Co., lately crushed at this mill, yielded \$14,000. New Empire Mill, Ophir Mill, near Grass Valley, is capable of crushing twenty tons in twenty-four hours—average yield from twenty to thirty live dollars per ton—not working their full force at present as they are sinking for a lower level—now down four hundred and fifty feet, with an incline shaft, employing twenty five hands, full force, one hundred men. This is one of the best arranged and most convenient mills in this State—one engine doing all the work of hoisting rock from the incline—four hundred and fifty feet—pumping from the same—running battery, amalgamator, machinery &c. The quartz is dumped at the battery. They have ample protection against fire in the shape of force pumps, hose, fire-buckets, &c. This company from the looks of things appear to have adopted the motto of "a place for every thing and every thing in its place."

Thanks are due Mr. F. Munsey, foreman of this company for courtesies shown. More anon.

Yours, &c.,
RADIX.

DR. N. I. Underwood, the well-known geologist, has just returned from the southern part of this State. He promises to make a full report of the regions visited in a few days. In his letter to the News he says: "The great mineral resources of California have hitherto been thought to exist in the North, while the barren ranges of the South, and the Southern interior have been almost entirely neglected. Having just returned from those regions, I candidly assert, that in their mineral resources, they are not inferior to Mexico or Washoe, while the climate is much superior to either of the latter places. In my report I will speak particularly of the Geography, Geology and Mineralogy of the regions through which I have passed."

Interesting Mineral Discoveries.

Some interesting developments have been for a long time in the process of development in the region of Sweetland's Diggings, on the Yuba. Copper almost pure, and sulphate of copper, has long been observed, in considerable abundance, and more recently 'plumbago,' or 'black lead,' as it is usually called, has made its appearance in great abundance, on the claims of Maj. S. S. Lewis. A fine specimen of this last mineral has recently been presented to the editor of the Nevada Transcript.—Plumbago, next to the diamond, is the purest form in which carbon is formed in nature.

The term, "black lead" as applied to this mineral is entirely a misnomer, as it does not contain the least trace of lead, neither is plumbago its proper name. The correct nomenclature is "graphite," derived from the creek "grapho," (I write), in allusion to its extensive use as a material for writing.—Graphite, like the diamond and mineral coal, is of vegetable origin. It usually occurs in masses or nests, rather than in seams. It occurs in granite, slate, limestone, and not unfrequently in greenstone. It is seldom found in very extensive deposits. From our recollection of the locality at Sweetland's, we presume it is found there in granite. It probably occurs as frequently and plentifully in New England and the region east of the Alleghanies and north of the Potomac as in any other locality on the globe. Quite an extensive mine of it is worked in Buck's county, Penn., near or in the town of Attleboro. It is also obtained in Brandon, Vermont, and Ashford, Conn., although the deposit in the latter place is about worked out.

Graphite is extensively employed in the manufacture of pencils. It is also much used for crucibles, on account of its extreme infusibility. It is also much used for diminishing the friction in machinery, and for manufacturing powder for polishing stoves, &c.

Should the deposit at Sweetland's prove extensive and easy to be worked, it will doubtless become valuable to the proprietors, by producing a home supply of a very useful mineral, the employment of which is constantly increasing, in variety and extent.

SINALOA MINING.—There is a great rush from California to Mazatlan, at this moment, to dig for silver in the Mexican State of Sinaloa. A letter from Mr. Pershacker formerly of Marysville, to Aaron Davis, Esq., of this city, dated at Mazatlan, gives a glowing description of the silver mines in that region. The ore is represented to yield from three to six hundred dollars to the ton. The Marysville Appeal mentions the recent return to that city, of Mr. N. E. Farrell, who has been successfully engaged in mining in Sinaloa, and who confirms Mr. Pershacker's statements. Mr. Farrell will return to Mazatlan immediately.—Transcript.

A BIG BAR.—A single bar of silver lately arrived from Washoe weighing sixty-seven and half pounds pounds. It came from A. B. Paul, Superintendent of the Washoe Gold and Silver Crushing Mills. Its value is \$4,782. E. Ruhling & Co., assayers in Washoe, give its contents at \$3,769 worth of silver and \$1013 of gold. It goes forward to New York straightway.

A QUARTZ MILL BURNED.—The quartz mill at Musquito Gulch, Calaveras county, caught fire on Monday, August 12th, from sparks from the smoke stack. The machinery was saved. The mill belonged to Vance of San Francisco.

WASHOE TRADE.—The San Juan Press says, that forty freighting teams were counted the other day, between the middle Yuba and Bope's Ranch, bound for Washoe. The trade by that route is immense just now.

IRON CANON.—The Red Bluff Independent says: One of the wildest and most picturesque places upon the Sacramento river, is that portion known as the "Iron Canon." It received its name from the peculiar formation of rock that walls in the turbid waters of the Mississippi of the Pacific. The huge boulders that lie strewn along the Canon have all the appearance of rock of iron; and at first appearance one would suppose that seventy-five per cent of their composition was pure iron, and imagination would conjure up the terrible convulsions of old Earth, that drew up from the fiery smelting furnace deep within its bowels, these huge metallic bodies, hot from their fantastic moulds, to cool upon the earth's surface. Black as the realms of Erebus, from which they came, their smooth caps glistening in the sunshine like helmets of bronze, they seem like silent giants, or statues rather guarding the narrow pass. On each side of this narrow canon rise walls of dark rock, lying shelf over shelf, strata upon strata, as if by degrees these mighty breastworks were built, and ages consumed in the building of each division. At other places, piled promiscuously up, are huge boulders of conglomerate, interspersed with crusts of pebble and cement. At the wildest portion of this canon, located some thirty feet above the level of the water, is a large arched chamber, cut from the solid rock, some thirty feet deep, and forty in width, its rock-ribbed sides and roof ornamented with hanging vines and green plants, while the sweet spice-wood that grows at its margin, makes the air redolent with perfume.

GOLD DUST SHIPMENTS FROM LOS ANGELES.—In the ten thousand rills of oro which pour their tributary riches in the lap of California treasure shipments, Los Angeles has never been included as contributing a share. In fact, the world conceded that our speciality was the was alone. We are informed by Wells, Fargo, & Co., of this city, that for the past six months, their shipments of gold dust has averaged \$15,000 per month, and is on the increase. Who knows, but with our constantly developing mineral, that this may be the real golden quarter of California yet.—Star.

THE ZAPATA MINING COMPANY.—This company which has so long been engaged in tunneling and other operations, in search of silver in the San Gabriel Canon, has transferred its interests to Dr. Underwood and Mr. Bagley, who will hereafter prosecute the work on the vein. On the last steamer, Dr. Underwood went to San Francisco and Sacramento, where he intends, we believe, opening a share list, to obtain the means of efficiently developing the mine. There is now no longer any doubt of the existence of a vein or the richness of the ore.—Id.

NEW PROCESS.—Mr. Leopold Nolf, who sometime ago discovered a new process for the saving of all the metal in the reduction of silver and gold quartz, and visited the mines in Mexico for the purpose of perfecting his plans, having satisfactorily demonstrated his system on ores from nine different prominent leads in the Washoe district, has filed his caveat for a patent. We hear by rumor that contracts have been made by the most prominent of the Washoe miners with Mr. Nolf, who will leave in a fortnight to erect his works in Nevada Territory.

SEARCH FOR A LEAD OF COPPER.—On the Castro Rancho, in the hills two miles south of San Leandro, indications of copper were discovered some three years ago, and a shaft sunk nearly fifty feet in depth, but without any definite result. The further prosecution of the matter was dropped and nothing more was done until a month passed, when a company of San Francisco gentlemen took the matter in hand, and are now vigorously pushing the investigation. They are determined to find the ore, according to the Gazette, if there is any in that region.

A NEW FORM OF BATH.

M. Mathieu (de la Drome), a well-known French orator, has lately been turning his attention to the subject of medicinal baths. A bath by immersion requires from two to three hectolitres of water, which in the case of mere river or spring water is of no consequence as regards expense. But the case is far different when the water has to be impregnated with medicinal substances, some of which are very costly; or when mineral waters are prescribed, which cannot be had in large quantities without considerable outlay, except at the spring from which they are derived. M. Mathieu (de la Drome) has therefore endeavored to ascertain, both by calculation and experiment, what is the real quantity of water which produces a useful effect on a human body in a common bath, and has found that it cannot be more than three or four litres in the course of an hour. To distribute this quantity both equally and economically on the body was, therefore, the question to be solved; and he has accordingly invented an apparatus which he calls *bain hydrofere*. The patient is seated in a kind of a box like that used for fumigation, while a powerful ventilator outside transforms the water which is to be used into a minute aqueous dust or dew, just as we see a high wind do with the water issuing from the jets of a fountain. This dew is driven into the box through an aperture on a level with the knees; and owing to the extreme minuteness of its particles, the latter ascend, and then gradually subside on the body. In a short time these particles coalesce and trickle down the body, until at last the water descends in an unceasing stream. This has now been tried with great success at the hospital St. Louis, and is generally attracting the attention of medical men.

THE BISSEL LOCOMOTIVE TRUCK.

The common locomotive truck consists of a frame, holding the four front wheels, and turning on a pivot, or king-bolt, like the fore axle-tree of a wagon. Although such a truck moves round a curve more easily than if it were rigidly parallel to other shafts and did not turn on its king-bolt, yet its action is hard, like that of a car whose wheels are nearer together on one side than on the other when moving on a straight track. With the Bissel improvement, the truck does not turn on its own centre, or pivot, but slides sidewise under the engine, being held by a radius-arm extending back under the engine, and fastened to a pin half-way between the centre of the truck and the forward driving shaft. Thus all the axles of the engine are more nearly radial to whatever curve the train strikes; the wheels are less likely to run off, and move with less friction; shorter curves may be passed, and the flanges wear less. The chief improvement is, however, that one pair of wheels may be used instead of two pairs, which are necessary in the old truck. Another incidental and considerable advantage is, that with a single shaft the bearing of the engine is thrown further forward, and the weight necessary to adhesion is thrown further back upon the driving wheels.

NEW FIRE ALARM.

An instrument has just been introduced, by Messrs. Taylor & Grimshaw, of London, which promises to be of great value as a fire alarm in warehouses, docks, vessels, and public establishments generally, as well as in private houses. It consists simply of an air-tight cylinder, with an India-rubber top, which, in proportion as the confined air becomes heated, expands and presses a spring, which, at any given elevation of temperature, will set free a common alarm, or fire a pistol or cannon. It is likewise capable of being adapted to furnaces, conservatories, and every place where exact ventilation is requisite, since the spring, instead of sounding an alarm, can be made to act upon an aperture for admitting air. It is portable and inexpensive, and the principle seems likely to be applied to a number of important commercial uses.

MEDALS IN ALLOYS OF PLATINUM AND IRIIDIUM.

M. Pelouze recently presented to the Academy of Sciences at Paris, in the name of M. Jacobi, medals of different sizes struck in alloys of platinum and iridium, fused at the laboratory of the *Ecole Normale*, by the process of MM. Deville and Debray. The alloys contained respectively twenty, ten, and five per cent. of iridium. According to the declaration of M. Jacobi, they were rolled cold and without annealing, with great ease, and presented the characters of the most ductile metals. Under the press they take a polish equal to that of coins; and the alloys rich in iridium showed a hardness rather greater than that of gold of 0.816. This hardness is proportioned to the quantity of iridium, as is also the resistance of the alloy to aqua-regia, which attains its maximum when the quantity of iridium reaches twenty per cent.

IMPROVED NAILS.

A French mechanic states that nails formed with two sloping edges may be driven into thin wood without the risk of splitting it, provided they are made to cut the wood across the grain. He recommends the manufacturers to make nails of this kind in order to save carpenters the trouble and loss of time involved in using a gialet or brad-awl.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths fine.....3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz, and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

PURE NATIVE SONOMA WINES.

RED, WHITE, AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them into the market, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma. M. C. VALLEJO.

At the depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo, for specimens of his Wines exhibited at the various Fairs held in the different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by

A. S. LOWNDES & CO., Agents,
617 Montgomery street, opposite Montgomery Block, San Francisco.

PRINTING OFFICE REMOVAL.

THE COMMERCIAL BOOK AND JOB STEAM
PRINTING ESTABLISHMENT

Has been removed to the New Office,
No. 517 Clay and 514 Commercial Streets.

Book Printing, Law Briefs, Catalogues, Business Cards, Hand Bills, Circulars, Theatre Work, American Flags, Envelopes, Badges, Bills of Fare, Programmes, Posters, Legal Blanks.

We keep constantly on hand and for sale, an assortment of

NATIONAL FLAGS AND BADGES,

In beautiful and extensive variety. Sole manufacturer of the

NEW UNION ENVELOPE,

With original and Patriotic verses. Everybody should use it.

Our Office is complete and perfect in every respect,

And we shall endeavor, in the future, to merit a continuation of that patronage which we have heretofore so generously received.

VALENTINE & CO., PROPRIETORS.

Please call and give us a trial.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connection with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed to growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut Bulls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plate or runner of each set is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the smut, chaff, Oats, Chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and draw up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest), and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals, whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. SILVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

QUARTZ MINERS, ATTENTION!

DR. BEETS would call particular to his Improved
AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not retard the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent, more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as milled with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,
J. B. BEETS

HUNT'S

IMPROVED FIRST PREMIUM
WIND MILLS!

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 208 & 201 Jessie street,
SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awarded the above premium: Devoe, Garratt & Ware; all of this city.

PRICES.—Eight foot wheel, \$50; Ten foot wheel, \$75; Twelve foot wheel \$100 to \$125
ap19 E. O. HUNT, Builder.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street.
nov3

MASSEY & YUNG.

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000

IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties interested to buy in the Stock in the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.

The Books of Subscription are open at the office of Bloch & Bayerquo where the required first instalment of 10 per cent, will be received.

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, with EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS.
DAN LYNCH,
720 Montgomery st. op. Metropolitan Theatre.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and salesroom for

Phelan's Patent Combination Cushions and Model
Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine.
M. E. HUGHES,
Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables

BERGER'S BIJOU BILLIARD TABLES,

WITH PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition a

Phelan's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine it. The Great Master, Mons. Berger, speaks of the Tables in the highest terms of commendation. To private families these Tables commend themselves, especially on account of their convenient size, and as an article of furniture for a private dwelling there is nothing more desirable; in short, no household or mansion with any pretensions to being well regulated, should be without one. Gentlemen about to build residences should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful, and health-giving game of Billiards.

M. E. HUGHES, Billiard Table Manufacturer,

And Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc.

Exhibition and Salesroom, No. 720 and 722 Montgomery street.

Manufactory, Market street, opposite Orphan Asylum.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY..... AUGUST 31, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. SKETCHING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

PROF. J. D. WHITNEY.

We are anxiously awaiting the results of investigations of our esteemed State Geologist, who is now at Virginia, U. T. Since his arrival and appointment to his present position, he has been most actively and diligently employed in his arduous task.

Though we may for a time be without the facts and items relative to his researches in that quarter, owing that these await the official publication, we nevertheless feel an interest therein that Nevada Territory and Esmeralda receive a scientific description; and if the many miners and companies would only avail themselves of his extensive experience, as well as his scientific acquirements in these branches, much time, expense and labor, would thereby be saved to them. From all items and statistics we can gather, we may fairly average a daily yield of from ten to twelve thousand dollars from the Washoe and Esmeralda districts. The present season has so far been one of the most propitious ever experienced, for transmitting machinery of every description, merchandise and provisions, besides an exodus from California operators who have gone thither. Last year but a few mills were in existence, and now upwards of fifty extensive mills and modern parting or smelting establishments, carry on a lucrative business. Such being the rapidity of the development of these new mining fields, in every particular, even politically as well as socially, that these new territories in the course of a few years will favorably compare, yes, even cope with California.

Want of Discernment.

We have too often reiterated the utter want of discernment in men who are placed at the head of committees in public undertakings. We have individually suffered from gross negligence, and of bungling arrangements perpetrated by such ignoramuses. We cite a case of this character. It were high time that some reforms ensue, *i. e.*, placing these old fogies of Committees on the shelf, and put up practical men, who understand the wants and requirements of California, who will see too, that our inventors and discoverers are properly appreciated. We take from the San Juan Press the following item:

Mr. A. L. French, of this place, has invented a drilling machine which is destined to work a complete revolution in the present mode of tunneling. It will perform four or six times the labor, in piercing solid rock, at less than half the expense now incurred, and thus save thousands of dollars to mining companies, besides enabling them to complete heavy works in a comparatively brief space of time. For the exhibition of such a machine, the freight on which, to and from Marysville, would amount to perhaps ten or fifteen dollars, the committee propose to award a framed diploma!

Per contra, the lady who sits a horse gracefully, and dashes him around the raco track at the greatest speed, is to get fifty dollars. The best piano forte is to take fifty dollars; the best church organ, fifty dollars; the best broom ten dollars; the best port innaime (needle work) eight dollars; for the best pulling team of six horses, one hundred dollars; best peanuts five dollars.

The lists are open for competition to the inventors of a quartz amalgamator, quartz crusher, tunneling machine, mining pump, (elevator model), water wheel, (driving model), for models of the riffle box, sluice rake, sluice fork, mining pick, drilling machine, and blasting apparatus. Whoever is decided to have exhibited the best, will be magnanimously rewarded with—a framed diploma! Inventive genius is here rated remarkably high! No doubt there will be a grand struggle among such men as French, Low, Smith (Francis), Matteson, Dunning, and others, for the great honor of getting that diploma.

To Our Mountain Contemporaries.

Dependent as we are for your faithful exchanges, we most bitterly complain of your utter negligence of mining news—the chief and most important resource of our Pacific State. Politics, it is true, may be advantageous in your pecuniary affairs, but first you should secure, encourage and stimulate with facts and figures, and berald to the world your extensive and rich mineral fields. It is but a slight task to inquire of your miners or mining companies in your vicinity, what their doings for the past week amounted to; they will cheerfully give you the desired information, besides bringing your interest before the world, and you would place us under obligations.

MARKETS.

The "Mercantile Journal and Prices Current," furnish us with a complete review of our market for the past week. We quote from it the following:

METALS.—Sales of one hundred tons of pig iron, prior to arrival, are reported on terms withheld. We make no change in our quotations of this article, as we are cognizant of any actual sale at lower figures, but observe that a proposition has been made through the columns of a contemporary to furnish three hundred fifty tons at forty dollars, deliverable at an early day. What amount of reliability attaches to this offer we are unable to state, but the market has been unsettled by it and fifty and sixty dollars a ton is regarded by parties in the trade as probably a fair quotation at the moment. We await further transactions. Yellow Metal are quotable at twenty-two cents, with moderate sales; all others in about the usual request and within range.

COAL.—Imports from January 1st to August 15:

Anthracite, tons.....	15,052	Sydney, tons.....	9,183
Cumberland, csk.....	931	Japanese, tons.....	25
English, tons.....	11,752	Vancouver L.,.....	4,197
Chili, tons.....	9,135	Coast, tons.....	10,594

The market is buoyant, and prices have improved as indicated by our quotations. We note sales of 500 tons Anthracite, ex Crockett and Phantom, at eighteen dollars fifty cents; 212 do. ex Galatea, at eighteen dollars seventy-five cents, and 641 do Sydney, ex Evangeline, at thirteen dollars. The supply is moderate.

MACHINERY FOR THE PACIFIC SUGAR REFINERY.—The ships *Noonday* and *Charger*, just arrived in our harbor, bring portions of the sugar boiling apparatus for the Pacific Sugar Refinery. The rest of the apparatus is on the ships *Cutwater*, *Magnet* and *Swordfish*. It consists of an enormous vacuum pan and its appurtenances. The whole is upwards of two hundred pieces of iron and copper which weigh one hundred and five tons. The freight alone amounts to \$3,700. This is said to be one of the largest pans in existence; only three others in Europe or America equal it in size. It will boil thirty-six thousand pounds of sugar at one time, which it is calculated to do in two and three quarters to three hours, during which time twelve tons of water are boiled out of the sugar solution. By boiling in vacuo, the temperature does not rise above one hundred and forty to one hundred and fifty degrees Fahr. Considerable amounts of machinery and implements for this establishment had already arrived per *Andrew Jackson*, *Star of the Union* and *Don Quixote*. When the ships *Cutwater* and *Magnet* arrive with the balance of the boiling apparatus, the buildings of the new establishment will go up.—*Alta*.

NEW MINING COMPANIES.—In the State office on Saturday was filed a certificate of incorporation of the Bright Star Gold and Silver Mining Company, of the Esmeralda mining district; capital stock \$100,000, in 1,000 shares. The Bull on Gold and Silver Mining Company of Mono county, capital stock \$960,000, in 9,600 shares, was filed in the Secretary of State's office on Monday.—*Mirror*.

BIG TOMATO.—A man in El Dorado county has raised a tomato this season, measuring seventeen inches, good measure, in circumference.

TO THE PUBLIC.

REPUBLICAN S. C. COMMITTEE ROOMS.

Nos. 19 and 20 Montgomery Block,

San Francisco, August 27, 1861.

The action of the San Francisco Times, formerly a Republican paper, in withdrawing the name of Leland Stanford from the head of its columns, and substituting therefor that of John Conness demands at our hands a statement of the position occupied by that paper in our party.

Within four days after the organization of this committee, a demand was made upon them for the sum of \$5,000, under a threat that if not acceded to, "other arrangements" would be entered into.

This demand emanated from the "Times Association," and was over the signature of their Secretary. Messrs F F Fargo and Thomas Fitch, who were the owners of two-twelfths of the paper, disclaimed any knowledge of the proposition, and advised us to take no notice of it. Since that time, the proposition, in one form or another, has been constantly thrust at the Committee, only varying in the amount, which has ranged from twenty-five hundred to the original sum demanded, of five thousand dollars.

Had the Committee been disposed to meet such an extortionate requisition, their self respect would have protected them from so barefaced an attempt at black mail.

We now say to the Republicans of California, that no change whatever has been contemplated, or will be made in our ticket. All the gentlemen composing it are true Union men, and we rely upon the patriotism of the people of California to see to it that it is triumphantly elected, and we confidently assure the public from returns received through most reliable sources from all parts of the State, that Mr Stanford's vote will exceed fifty thousand.

OFFICE REPUBLICAN STATE COMMITTEE.

Nos 19 and 20 Montgomery Block.

San Francisco, August 27, 1861.

To the proprietors of the San Francisco Times—Sirs: The State Central Committee of the Republican party, at the commencement of this canvass, contracted with you to insert, at the head of the first column of the Times, the Republican State ticket, headed by Leland Stanford, together with the names of the Central State Committee. That contract has been violated by you by substituting the name of John Conness for that of Leland Stanford; and we therefore and hereby demand of you to withdraw our names and those of the Republican nominees from the columns of your paper, and refrain from publishing them for the future.

WM SHERMAN, Chairman.

ALFRED BARSTOW, Secretary

STATEMENT BY MR. HARTE.

SAN FRANCISCO, August 27th, 1861.

WILLIAM SHERMAN, Esq.,

Chairman of Republican State Central Committee—Sir:—It is due to the Republican party that I should state that the San Francisco Daily Times has been under the control, since June 3d, of an association, consisting of elicit printers and the editors of the paper. I believe it is a fact that all the printers are Democrats. The editors under the association arrangement from June 3d to July 22d, were Mr. Fargo and Mr. Fitch. About the middle of July I took the place of Mr. Fitch, and on the 22d purchased the interest in it by him a d Mr. Fargo, and took charge of the paper as editor. While under my care the Times was a zealous and radical Republican Journal. The decision of the printers to withdraw the name of Mr. Stanford, and put up that of Mr. Conness was made suddenly and without my knowledge, yesterday afternoon. As soon as I heard of it, which was about five o'clock, I protested against it, and warned the printers that the proceeding would deprive the Times of all the support which it received from the Republicans. I also immediately informed several members of your Committee of what was about to be done. Having exhausted all means within my power to prevent the contemplated publication, without effect, late in the evening, I consented, under the compulsion of the circumstances, to transfer my interest and retire from the paper.

Very truly and respectfully yours,

EDWARD HARTE.

NEW METHOD OF TREATING POWDER WOUNDS.—Instead of treating powder wounds by the painful process of digging out each single grain of powder with the knife or needle, Professor Busch recommends the fomentation of the wounded part with a strong solution of corrosive sublimate. This application produces no eczematous inflammation; some of the vesicles dry up and others form scabs. On removing such scabs, the grains of powder are found to adhere to its under surface, and underneath it a newly formed spotless epidermis is found. The scabs and epidermis scales, together with the grains of powder, may then be scraped off with the spatula. Any other strongly irritating substance may be used with success. The solution of sublimate recommends itself the most, because, in using it, the degree of irritation can be controlled pretty accurately and because, after the healing of the aczema produced by it, a white skin remains.

The governmental expenditures of Great Britain are £215,000, more than a million of dollars per day. The people consume seven hundred thousand dollars of food per day, more than their soil produces.

SUMMARY OF MINING NEWS.

CALIFORNIA.

seems somewhat remarkable that but little interesting mining news, in comparison with other counties reaches us, from such mining districts as we know are extensively rich and prosperous. We have searched in through Nevada, Placer, El Dorado and other important mining county files, and find them barren and devoid of such items. It is true that the destruction of La Porte, where the Mountain Messenger was published, that paper furnished us with considerable information of their mining activity.

At a great many miners and companies object to furnishing items of operations on account of so many thefts by sliver robbers being perpetrated we are well aware of, but that need not hinder them from giving intimations of their progress, which would be in place of sums and figures of interest. Our great object is to keep before the world an account of immense mineral wealth, that must ultimately attract hither an immigration to develop these our chief resources—mines and mining.

Columbia County.—The Columbia Times brings the following interesting items. The Northern Light Company, probably the largest placer mining company in the State, are conducting their operations at Campbell's, in a manner and on a scale that must be advantageous to the stockholders and beneficial to the State. Acres of earth and rock have been hauled away and removed with the aid of a few months, and everything has been done in such a systematic manner that their works afford the best illustration of the advantages of the combination of capital, skill and labor in mining operations to be found in the State. Tunnels and flumes intersect for extensive claim in all directions, which, together with their many hydraulic, enable the company to wash more dirt in one day than an ordinary mining company could in a year, with a corresponding profit. We recorded our mining flumes to take a look at the works of this company, and were the advantage of combining in mining operations. The flume is a great flume. The working of this important work, under the supervision of Captain Burtwell, is progressing as rapidly as the nature of the obstacles to be overcome will admit. The cutting through some 200 feet of bedrock boulders to the depth of twenty feet, and a width of eight feet, necessarily be a slow operation. The new flume is already down the full of more than one hundred feet, and we are informed that it will all be hauled up to the main street bridge to a depth of some eighteen feet for the grade of the present flume during the next spring. We sincerely hope that it may, as it will be an immense benefit to every member of the community. . . . Three men, Brady, Hayes and Griffin, who have been working on a gulch near the high flume on the Yankee Hill road, last week obtained 150 ounces of gold for their labor. The gulch where these men are working is the same in which an Italian some eight years since and a lump of gold worth several thousand dollars, and which was considered as worked out a year ago. We hope the success of these men may induce others to try the experiment of working over some of the placers that were worked out by the forty miners. Cheap water and improved methods mining will yield good remuneration to industrious men, in almost any of the gulches in this county if they are not worked perseveringly. A week's work, followed by a month's loafing, is not the way to succeed as a miner, so many appear to think. The gold obtained by Brady & Co. was a lump weighing from three and four ounces to two and a half pounds. . . . A well-known correspondent of the Courier, who recently went to Mendocino, writes from that place, August 6th: Nothing of moment occurred on the gold fields last week, but a passing notice only of the discovery of one of the richest quartz leads I have believed, on Sugar Pine Creek. It is owned by a man named, I think, Harvey Burgess. He has about 40 tons of quartz mined and in the ledge alone, in sight, not less than \$40,000 to \$50,000 as yet not mined. It is the richest thing I have ever seen in California, with the exception of the celebrated Allison lead in the Northern mines.

Tulare County.—The Sun brings the following: The placer mining various districts is of such a character that there is little to notice of its usual regularity. Those who work may wish to do better, yet trying tried other portions of the State, think the prospects here as good as any have had elsewhere; at any rate there is a certainty of a living for the present, and seeing their labor is never entirely lost, they are never encouraged to look for the future. Some of the miners have at times been excited by excitement, yet after exploring the country in the British possessions north, and penetrating Mexico south, have returned to the more peaceful, domestic mines, determined that whatever portion of their lives shall be devoted to the search of the precious metals, shall be confined to the auriferous hills and beds of Kern river. Numbers, who this spring for Bear Valley, Mono, and other places, are now returning after a long accumulation of money, and are now ready to be classified as the usual methods of prospecting about four thousand dollars per week. With the facilities offered working men, I am surprised that these mines are not full of laborers. The proprietors of mines, who also own many valuable leads, offer to let them be worked on share, giving the laborer one half of the gross yield of the rock. It is a very poor lead which will not more than pay the expense of getting out the rock, yet the laborer is sure of half-gold or bad; and there is always a chance of a good strike, which often means a fortune. The miners generally are doing well. The interest in quartz mining has revived and new discoveries are almost daily made, some being unprecipitated rich rock. Mr. Manning, by astrak, has obtained \$550 on seven and a half tons of rock. Therefore he will have the quartz crushed at the mill. Lane & Butler, working with horse power, are doing well.

Trinity County.—A correspondent of the Appeal gives the following graphic description of mining as carried on in this county: As Agriculture can never be of much account in such a high and mountainous region, the mines, of course, are of paramount importance, and though no such great riches as were made are now found, the yield of gold is steady and profitable. On Greathorn Creek, a few miles southwest of Yreka, there are now several hundred men profitably engaged in creek mining, getting out some more than a good paying gulch, and just beyond the old wooded creek, where fortunes have been made, there are also good paying claims. On Yreka Creek, at the upper end of the flat, known as Hinksville, there are numerous claims. These latter are supplied by the great Shasta flume, which supplies the head-waters of the Shasta river, some twenty-five miles from here. In Humberg Creek, just over the mountains of that suggestive name, is a thriving mining settlement, in whose vicinity some three hundred men are at work. A quartz vein has been discovered, but it is not yet worked, and is only everywhere on Yreka flat, which has obviously been made by the washings of the surrounding hills, and as with all mines in such cases, it is the established belief of the miners here, that the very richest pay dirt is to be found right under the town, where it cannot be got at, of course. But they have come as near the town as possible, sinking shafts into rich pay dirt all around the edge of town, having first run drains from the creek, and in that way successfully destroying the wells of divers much abused creek, whose supply of water has sometimes disappeared in a single night. To do drifts, too, on the various shafts around town, have been in occasional use, and the result may be seen in yawning cracks and seams, which fearful fissures on the surface constitute unpleasantly, though they who have mined the rows below do not seem to mind it, evident, y considering the drift of two amount in their favor, as miners' riches are before all others. Since the excitement concerning the Nez Perces mines has sprung up, the mining population of this county has been greatly increased, and many thousands of men have been coming from this county alone. Accounts from there continue to be quite contradictory, as the reader well knows.

Sierra County.—A correspondent of the Sierra Democrat, writing from Chip's Flat, furnishes the following mining news. Batsan Flat is lively. The diggings are paying well. The Late Yankee Company has the tunnel in about 300 feet. Having run too high for the channel, the company has now run an incline of 100 feet where blue lead is struck, and the incline is now breasting in as good looking gravel as I ever saw in this region. They have washed a little dirt as a prospect, and the owners are satisfied that it is rich. The specimen I saw, of gold and quartz mixed—a very handsome nugget. The workmen of the Morning Star Company have also got their tunnel in, and after putting down an incline of 60 feet, have commenced breasting in very good gravel. The boys are all in good spirits, and they have what is called the "dead wood" on their pile. The United Company are doing well. Finding the rock pitching towards the hill, the men continued the tunnel, and have now got into a channel never before found by any miners on the flat. It pays better than any other ground ever worked by them. I presume the Banner, Minot, and Green Creek companies will soon put on extra shafts and continue their mine until they reach the level of the flat. This will be a lively camp this winter—and quite a town. Lots are sold off for a considerable distance around; towns are hauling lumber; miners are clearing lots and building cabins; and the hum of the saw, and the ring of the hammer, make one think of olden times. At Minnetonka, the miners are doing well. The little town has quite a lively appearance. At Greenfield, the Downsville and Branch tunnel companies are taking out from three to four ounces to the share per week.

Placer County.—The Placer Herald has the following encouraging items: On Horse Shoe Bar, the Race Company, who have worked their claim for six years past, last week struck a vanner of their pay dirt, and in one day washed up forty ounces, or about seven hundred dollars. They have been taking out the wages ever since. The company consists of Blomond Lyons, John Cronin, Tim Leary, Sam Sheridan, Bob Murray, C. Connor, and Spurr Cronin. Good luck to the "Race"!! . . . The Economy Company have also struck good pay dirt, much better than was expected, and are in a fair way of being well rewarded for their enterprise. The members are Billy Wilks, Tim Leary, Fred Shearer, Roland Charley, and Bill Kent. Success to the "Economy." . . . The Grapeland-Git Company has also been turning itself and hardly behind any of them—it is paying handsomely. The members are George Langdon, Cap Mooney, Charley Tracworthy, and Tom Patton. All hail to the "Grapeland-Git"!! . . . The Grapeland-Git Company, on Gray Eagle Bar, the Fankler, Lyons & Co.'s bank claims are paying extraordinary wages. In one day last week they took out \$100—since which time it has yielded handsomely. Long may it pay. . . . Miners on Mel Canon Bar, Greenhorn Slide, Voiceau Bar, &c., are said to be doing remarkably well, and we may expect to hear before long of some extraordinary pay dirt being taken out in these localities.

San Bernardino County.—The Star says: We have pleasure in being able to state that the boiler for the quartz mill of Mr. Melins has been safely landed in Hole mine Valley. It was supposed, from its great weight, 8,000 pounds, that it could not be hauled over the mountains, but by the ingenuity and perseverance of Captain W. T. Bradford, who took charge of its freightage for hauling and hitching, the feat was accomplished. The wagon left here on the 17th of July, and arrived at the Valley on the 13th of August. The turnpike road is very good or ordinary, and the heavy monster boiler was hauled over it, has established it as the route for wagons to the Holomibe and Bear Valley mining region. All wagons from Las Angeles and San Bernardino now go by the turnpike—the old Spanish trail, made into a good wagon road, having grass and water within easy distances. Immediately on the arrival of the boiler, it was put in its place, everything being ready for it, and in a week or two the engine will be at work.

Humboldt County.—The Red Bluff Independent remarks that it possesses some gold specimens from the Abba Nevada, Bioma Vista District, Humboldt county, of some four bits in value, taken from half a panful of casing. The specimens were sent to Mr. Ruscroft, by W. J. Whiting, of Humboldt City. The gold is in coarse particles, and unaltered with any other mineral, resembling California gold, though somewhat lighter. If the Abba Nevada mines continue to yield as profusely as the above would seem to warrant, the gold alone would pay for the working, to a number of the silver yield. There is no doubt but that the Humboldt country is destined to be one of the richest mineral producing countries in the world.

Los Angeles County.—Rich gold deposits have lately been found in the San Fernando mountains, one day's ride from Los Angeles. . . . The Gazette contains the following item of another discovery of coal veins: Some weeks since, coal was said to have been discovered in the county. Now news comes from Los Angeles county that rich coal veins have been found near Santa Anna, about twenty-five miles east of the town of Los Angeles. The specimens are bituminous in character, and several beds in different parts of the county have been discovered. Workmen are digging in order to test the extent and value of the veins.

Amador County.—The Ledger says the waters of the Volcano ditch are now conveyed across Union Flat (near Volcano) through an 8½ inch galvanized iron pipe, 15-20 feet in length. The greatest pressure (at the lowest portion of the pipe) is 160 feet incline. With a full head and 90 feet pressure proper, the pipe will convey 200 inches of water. The construction of high flumes will soon be dispensed with. Galvanized pipe is a great deal cheaper, and has no chance to blow down.

El Dorado County.—The Placerville Republican has the following: The mines at Wild Cat Bar are prospecting better than ever before, and the citizens of the town are rejoicing in the possession of paying claims. . . . We learn that Pacific street is to be extended from its present terminus on the hill above the quartz mill, to Cedar Ravine. The extension will be a great convenience to those residing on that street.

Butte County.—As one Fountain, a contractor, was digging a cistern at the intersection of Main and Coloma streets, opposite the Curry House, Placerville, on Monday 16th, he found eighty feet down, dirt that paid \$2 25 to the pan. At the same distance down he found a piece of gold that was worth \$55 50, at the rate of \$17 50 per ounce.

Calaveras County.—A correspondent of the Union says that from the four mines now being worked, an average of two hundred tons of ore per day is taken out and crushed. The average value of this is eighteen dollars per ton. The total yield for these mines for this month of August, is expected to exceed \$75,000.

Nevada County.—Trenthorpe, Cliff & Co. cleaned up to-day at Ben McCaig's, (old Sebastopol) mill the snug little quota of twelve thousand dollars, the product of one hundred and ninety tons of their lead on Osborne Hill, being about sixty-three dollars to the ton.

NEVADA TERRITORY.

Little, if any, mining news of note reaches us now from this quarter, it being, perhaps, owing to the irregularity of the Daily Overland Mail—the non-interest of its journalists there, or other causes. On the contrary, we find more political trash and buncombe speeches than any other and more important matter. The Territorial Enterprise contains a communication from Dr. Degroot, a favorite correspondent to the press on the Pacific coast, in reference to his appointment as Census Agent.

From the Folsom Telegraph we learn that W. L. Perkins has received with him, in the past few days, two shipments of silver ore, valued at 1,500 lbs. from the Central ledge, and the other of 2,000 lbs. from the Gould & Curry ledge. The silver mine of the Spanish Company, at Virginia City, it is thought, will yield \$60,000 or \$70,000 during this month. . . . The Times has the following important items: During a hasty trip through Gold Hill, on Thursday, we noticed three new quartz mills in course of erection and several new houses. We intend to call on our Gold Hill friends this week and note their progress. . . . James Holman brought us in some fine specimens the other day, taken from the "Waller Defeat" claim. It closely resembles Gold Hill rock, and is "very rich." . . . The Crown Point Mill will have four arastras, and a large furnace for burning ore in operation soon. . . . Mr. A. Staples is erecting an eight stamp mill at Gold Hill. The mill is to be run by a twenty-gig horse power engine; and Mr. Staples expects to crush ten tons of ore per day. The Veach process will be used in

this mill. It will be in running order in another week. . . . Captain Conay has gone to San Francisco to complete the arrangements for another mill to be erected at Silver City. Gold Canon will soon resound with the music of the quartz mill from one end to the other. . . . An eight stamp mill has been constructed for, to be erected near the lime kiln, on American Flat.

WASHINGTON TERRITORY.

Correspondence in the Portland Advertiser from Prairie City, W. T., dated 28th July, says: Prospectors have been warned by the Indians not to return, as they are determined to oppose any further mining, except such as they are entitled to by treaty. One party returned to this town, but set out with increased numbers a day or two afterwards. Looking Glass, one of the Nez Perces chiefs, crossed the mountains with five hundred braves, and it is rumored that he is going to propose an alliance with the Snakes. I suspect, however, that he is only gone on a buffalo hunt, and this is the season for that kind of sport. It is certain, nevertheless, that the Nez Perces are discontented, owing to the failure of Government to fulfill their articles of treaty. A war at this moment would be a serious, if not a disastrous matter for us up here. The Nez Perces are a powerful and dangerous enemy—brave, intelligent and well armed—and steps should be immediately taken against any accident arising from their present dubious position. I have seen specimens of gold brought in from the South Fork: it is very coarse and heavy, and is what is called nugget gold. A pack train left Oro Fino on Sunday for South Fork. There may be some trouble, but the miners are now in such numbers, that little danger is apprehended. On Oro Grande miners are making good wages. I have seen some beautiful gold from that vicinity. Rhodes Creek continues to pan out largely. I could enumerate many claims paying from twenty to fifty dollars a day to the hand. One claim paid this week to the hand one hundred dollars per day. There are eleven men employed in this claim, and on Thursday last, they took out one thousand two hundred dollars. If claims are there which do not pay, I have not yet found them. There are a large number leaving for the valley, but I think they find the season rather advanced, and intend coming here early in the spring. The Nez Perces mines can be worked until January and persons wintered here say the snow never falls deeper than three feet, except on the mountains, and many here now assure me they have worked all winter, and had little trouble. The road will be kept open, and as provisions are cheap and plenty, there need be little fear of famine. There are parties putting in crops, and in spring the numerous warblers around here will be green with corn, potatoes and vegetables. Hay is found for sale at almost all our stores, and horses are ranches for two dollars per head, per month. Beef—why we are tired of the article; it is a drug in the market. There are some claims here paying one hundred dollars to the hand, though they are very scarce. I think the claims now worked will average ten dollars. The mining country extends over fifteen miles square, and is mostly confined to little creek and gulches. There are about three thousand men here; about one half of whom are at work. The mines, I consider, are over-run with fortune hunters. Many are returning to the West. This is no place for chaff men; it takes hard work and shrewdness to make it pay. A trapper lately in the employ of the Hudson's Bay Company, has been exhibiting at Stockton, a lump of copper found near the head waters of Missouri, one hundred miles east of Nez Perces, Oregon. The piece is of virgin copper, a pound weight, interspersed with lumps of silver. He says there is a great quantity to be found on top of the ground in that region.

MEXICO.

A correspondent of the Ymir writes thus from Hermosilla, Sonora: The poor old mines of the Ymir river, which a few months since promised such great wealth, have by degrees diminished, until there only remains a place where there might have been mines, had nature so intended it, and their debris have been left the country. There are good quartz mines here, that in time will pay. But let me say to the Whites, see if you can where you are, and do not believe the stories of those interested in the place. There are no mines here of any account, and unless you have capital to open and work the silver mines, keep away from Sonora. I have been deceived in it as well as many others; but I now write from a perfect knowledge which I have gained by traveling over the State. There are a great many men who would be glad to see an emigration of miners from California, and as soon as their money was spent, would be glad to see them going. There are over twenty men here, who, within the four months, have left the California mines, that are now destitute, and, as a matter of course, have no spend—their money is gone. The thermometer ranges from nineteen to one hundred and ten. . . . Dr. Melville writes to the Bulletin from Ures, as follows: I have just returned from a tour through some of the mining districts, such as San Xavier, Soyopa, San Antonio, De la Huerta and so on. In the last district I saw fifteen Americans, some of whom owned an interest in silver mines in the vicinity, which for richness have great reputation. Among these mines I may mention La Mina Blanca (the property of William Blumhardt of Guaymas) and La Mina Prieta (owned by a company of Americans). But there are a great many more excellent about a new mine lately denounced by Rontreux, Waterman and others of San Francisco, called La Misfiora, and which is just now being opened; and to Judge from what I saw and heard from the most experienced miners of the place, it bids fair to be one of the richest in the State. It is supposed to be on the same lead as La Prieta. There are several other mines in this district which are undoubtedly very rich, and which are at present being worked on a very small scale. In San Xavier, the mines, Los Bronzes and La Cruceta, are being extensively worked, and are paying well. Several others are being worked in a small way by a poorer class of people. In Soyopa, the mine, La Mina Prieta, Dr. Soyopa is spoken of as being one of almost unparallel richness. It is the property of James H. Smith, a merchant of Ures. This country, it appears to me, now presents the greatest inducements to capitalists, and in fact the people are beginning to be interested. Mines are being reopened that have lain dormant for one hundred years. Times are much livelier here now, and business is better than it has been for many years; and as we have peace which promises to be permanent, I have no doubt but that in two years from to-day the country will be in a flourishing condition. But while I would advise men of money to give our mines a trial, I would say to laboring men, stay away for the present. Wages are too low for white men.

Sinaloa.—A correspondent writes to the Appeal from Mazatlan, thus: The following mines have recently come into possession of Americans, and as soon as the rainy season is past, will be actively worked. Prieta mine, situated at Yacahual and eighty miles from Mazatlan, owned by Breit, Ventana Gold and Silver mining company, St. Nicholas, near Ventana—same proprietors. Los Angeles, at Buena Vista, two hundred miles distant, owned by A. Harpington. Sombreno, at Capallo, sixty miles distant, owned by Harpington, Pershacker & Chmrdill. Discoborata, at La Puerta, one hundred and forty miles from here, owned by A. B. Ehler & Co., and Tale mine, at Rosario, sixty miles distant, owned by H. De Broet & Co. All these mines have been worked before, and are known to be remarkably rich. There is no scarcity of labor in Sinaloa, but the main thing is to find a good one, on a good road, with water and wood sufficient to work it. Such mines are few, though the above named have all of the advantages enumerated, and most of them have the old buildings, which were erected by the Spaniards, who opened and worked them successfully till they were driven out of the country. The mines are principally of silver, though some produce both gold and silver.

MASSACHUSETTS.

The Boston Commercial Bulletin says: Ingot copper is quoted at \$3 25 per ton and a half. Lead is quoted at \$1 25 per ton. The great Minnesota cannot net more than three dollars to four dollars a share per annum. Some of the Portage Lake mines and the cliff, doubtless, do as well as the Minnesota. One or two may do better, but speaking generally, seventeen and a half cents per pound for ingot copper is fatal to American mining.

THE ART OF DENTISTRY.

Few persons realize the rapid growth of dentistry as a profession. Forty years ago doctors officiated as tooth pullers, and if decay seized upon a molar it accomplished its work unimpeded. It is an actual fact that in 1820 there were hardly more than thirty practising dentists in this country. Ten years after that, the invention of artificial teeth had given such an impetus to the profession that the thirty had increased to two hundred. In 1842 it was estimated that there were one thousand four hundred; in 1848, two thousand. In 1850 the census reported 2,923 practising dentists; and at the present time there must be at least 5,000. American ingenuity long since superceded the artificial teeth which were at first manufactured by the French. In twenty years the number of teeth made here has increased from 250,000 to 5,000,000. For all these grinders we cannot find occupation, and a large number are exported. The capital employed in this single branch of industry is upwards of \$500,000. A single firm in Philadelphia use seven hundred moulds, producing 9,000 different shapes and styles of teeth, costing upwards of \$18,000. Of platinum alone three hundred ounces a month are used simply for pins to fasten the teeth in their places. This firm manufactures 180,000 finished teeth per month. The value of gold-foil it sells amounts to \$109,200 per annum. It is estimated that the 5,000 dentists in the country use no less than \$2,500,000 worth of gold per annum.

APPLICATION OF POISON TO THE CAPTURE OF WHALES.

Professor Christison, of Edinburgh, has recently published an account of some remarkable experiments for the capture of whales by poison. The agency employed was hydrocyanic, or prussic acid, inserted in glass tubes, and in weight about two ounces. After various trials to overcome the difficulty of discharging the poison from the tubes, a mode was arranged of attaching one end of a strong copper wire to each end of the harpoon near the blade, the other end of which passed obliquely over the tube, then through an oblique hole in the shaft, and finally to a bight in the rope, where it was firmly secured. When the harpoon struck the whales the tubes were crushed. On one occasion, a fine whale was met with; the harpoon was skillfully and deeply buried in its body; the leviathan immediately sounded, or dived perpendicularly downwards, but in a short time the rope relaxed, and the whale rose to the surface quite dead. The crew, however, were so appalled by the terrific effect of the poisoned harpoon that they declined to use any more of them; but professor Christison is confident, from subsequent experiments, that success will be fully attained in this mode of capture.

WEAR OF GOLD AND SILVER COINAGE.

The Gazette of St. Petersburg gives a curious account of an experiment recently made at the mint of that city, for the purpose of ascertaining the comparative loss by the ordinary wear of gold and silver coin. It appears contrary to the generally received opinion, that gold wears away faster than silver. The means employed were as follows: Twenty pounds of gold half-imperials, and as much of silver coopeks, — coins of about the same size, — were put into two new barrels, mounted like churns, which were kept turning for four hours continuously. It was then found, on weighing the coins, that the gold coins had lost sixty-four grammes, while the silver coins had lost only thirty-four grammes; but as the number of gold pieces were twenty-eight per cent. less than those of silver, the proportion is greater to that amount in favor of the latter. It must however be mentioned that the silver contained more alloy than the gold, the standard of the former being 868-1000ths of pure metal, and that of the latter 916-1000ths. The result of the experiment is, that the pecuniary loss on the wear of gold coin is about thirty times more than on silver.

DO RAILWAY RAILS EVER WEAR OUT?

Mr. Herapath, editor of Herapath's *Railway Journal* (England), states, on the authority of some of the most practical and experienced railway men of Great Britain, that railway rails, unless at stations and places where there is sliding, do not sensibly wear out. This statement, however, applies to rails made of good iron, — not inferior iron tied over, as it were, with good, — and to rails on the middle of a line, over which trains are run in the ordinary way. Experiments have been made by taking up and carefully weighing rails in this position after twelve months' wear, or more, which were found not sensibly to have lost any weight during that time, thereby proving that there could have been no sensible wear.

ON THE USE OF STEAM EXPANSIVELY.

Much interest is now felt among engineers as to the economy of using steam expansively. Mr. Isherwood, chief engineer of the United States Navy, after a long series of experiments in the Brooklyn Navy-yard, came to the conclusion that there was no appreciable advantage derived from working it expansively. Recent experiment at the Metropolitan flouring mills, in New York City, where there are two pairs of very fine engines, indicate, also that there is no advantage in it, in spite of the very evident theoretical gain.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Luceroe, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Obio and Buckeye Co. Argentine, \$12.
Chimney rock, \$15.
Dargen, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caney Ledge, \$25.
King Charles, at Flowry, \$6.
Edgar Co., Great Western Ledge, Gelena, \$20.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.
[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FINE CLASS FHELAN'S TABLES, will be opened for business on SATURDAY, 20th, 1861. The undersigned respectfully solicits the patronage of all TLEXEN Billiard Players, and hope by conducting their Saloon in an unusual manner, to merit their continuance and support.

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING,

..BUT THE BEST FOR..

MANUFACTURING CLOTHING

..AND..

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Camere and Tween Suits, etc., from materials made at the Mission Wool Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them is not surpassed.

Various styles of Machines have been employed on the above material but the Wheeler & Wilson is preferred.

DONALD McLENNAN,

Proprietor of the Mission Woolen Mills

Jly 6

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supercede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that, 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silverthorn, Government House, San Francisco." We warrant this machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement Dealers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

P. H. STANDISH—Sir: We, the undersigned, did on or about the first of May, see your newly improved Cam Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

Yours, truly,
G. W. HAMMETT, A. BALDWIN,
M. CROGER, CHARLES McALPIN,
H. R. MEACHAM.

June 12th, 1860.

P. H. STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday morning; it was rank thick grass and very much lodged. It performed well, well as any machine could do. I saw it cutting oats in Mr. Harriet's field, and I am pleased with its performance. The cam wheel power over the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging bearings and boxes, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,

ELAM BROWN.

PACHECO, June 23, 1860.

P. H. STANDISH—Sir: This is to certify that I have operated one of your reaping machines, and find it to be, in my opinion, one of the best machines now in use, knowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife, or eat any grass.

G. F. BROWN.

Witness: Washington A. Wilson, W. T. Hendrick.

LAFAYETTE, June 27th, 1860.

P. H. STANDISH—Sir: I saw your mower at work in down clover and oats very heavy growth; it performed better than any mower I have ever seen. Its simplicity, durability and lightness of draft, it certainly has not its equal.

Respectfully, yours

WARREN BROWN.

PACIFIC FOUNDRY AND MACHINE SHOP, First street, between Mission and Howard, San Francisco, California—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight and Compound Mills of all sizes and designs; Stamp mills and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Milling Machines of all sizes and kinds; Flouring Mills; Gang, Sash, Mulay, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills; of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Stemboast work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight

of Stamps, Twenty-Five per cent. more rock

than any other mill yet invented. It is also

Cheaper, more Durable and run with Less

Power. All parts of it being fitted together

before leaving the shop, it can be put up and

set at work Crushing the Ore, in Ten Hours after

arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Bartola Mill Company,	
Ophir Mining Company,	} San Francisco
Ordon Reduction Company,	
Ogdon & Wilson,	

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with its improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is bucked, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, SEPTEMBER 7, 1861.

NO 24.

FROM OUR TRAVELING CORRESPONDENT.

NEVADA, Sept. 24th, 1861.

EDITOR MINING AND SCIENTIFIC PRESS.—SIR.—On the night of August 24th, the town of Omega, Nevada county, was totally destroyed by a fearful conflagration. The fire broke out in the wash room of C. D. Van Vranken Hotel, known as the Omega Hotel, caused by a candle being left in a "Pike County candle sick," (a block of wood with three nails to support the candle) and allowed to burn down, which communicated the flame to the surrounding wood work. The fire spread with fearful rapidity, barely giving the inmates time to escape in their night cloths—a lady actually leaving a valuable set of false teeth, which she had not time to reach from an adjoining stand. The people were obliged to leave the immediate vicinity, owing to the constant explosion of pistols, powder, and quicksilver, in the various stores and dwellings. Nothing was saved. The next morning presented a dreary aspect: what the night before was a thriving town, was now a heap of burning embers, with a large number of men and families hovering around. An ox was driven up, killed, dressed and roasted on the burning ruins. A store house beyond the reach of the fire was opened, and breakfast on the spot was relished by those who had lost their all,—their long and doleful faces now and then provoked a laugh and jest of their own ludicrous appearance.

Active preparations are being made to rebuild the town, and the indomitable spirit of mountain enterprise will soon replace what the elements have destroyed.

Yours, &c.

RADIX.

THE PIONEER FOUNDRY.—Among the many enterprises engaging the time attention and capital of our citizens, we consider the builders of the Pioneer Foundry worthy of great praise. They are engaged in an undertaking which cannot fail to benefit all classes. Quartz mill owners will be the most directly benefitted. Now they have to send to Sacramento or San Francisco for new castings and repairs to their machinery, thus incurring a great expense and perchance a greater loss of time. In another month the Pioneer Foundry will be in operation and the time and expense of sending below avoided. The foundation walls of the Pioneer Foundry have been laid about half a mile above Devil's Gate. The foundry building when completed will be forty feet front on the road by thirty deep, attached to, and back of the foundry, a machine shop forty feet square is being erected. Both buildings are to be of brick, one story high. The machine shop extends across the canon, and will rest upon three arches of eleven feet space. The foundry will be of sufficient capacity to melt three tons of iron and make castings of most any size and shape required. The machine shop will be stocked in the most complete and perfect manner. Lathes for turning in wood and iron are now on the road. The machinery will be driven by an upright engine of eight horse power. Boiler and engine are located in the basement, on the bed rock of the canon; and so arranged that there can be no possibility of firing the building. The whole will form one of the most complete foundries and machine shops on the Pacific Coast. When the institution is put in motion we will give an extended notice of its inside.—*Washoe Times*.

A DESIRABLE INVENTION.—The inventive talent of the country is now devoted to the production of improved arms and more destructive weapons of warfare. An inventor in Marblehead, Massachusetts, exhibits to the Government a small shell, the explosion of which, he says, "would kill the devil."

Large Iron Forgings.

Mr. Mallet has read to the London Institution of Civil Engineers a paper "On the Coefficients of Elasticity and of Rupture in Wrought Iron, in relation to the volume of the metallic mass, its metallurgical treatment, and the axial direction of its constituent crystals."

Iron was formerly entirely worked under tilt hammers, the process of rolling was then introduced: and now in consequence of modern engineering requirements, masses of iron of considerable magnitude, were produced by fagoting together under heavy forge hammers, from large numbers either of bars or slabs grouped together. The masses were not, however, found to possess ultimate strength in proportion to the number of bars of which they were composed; in fact, it appeared that the strength of the mass became less in some proportion as the bulk became greater. This was admitted as a fact, but no one had hitherto attempted to show experimentally what function of the magnitude was the strength of a given kind of iron, manufactured in a given manner; or how the same forged mass, when very large, differed in strength in different directions, with reference to its form; or how the mechanical part of the process of manufacture of the same iron effected its actual strength, either as a rolled bar or as a forged mass.

Addressing himself to this investigation, the author dealt generally with three points of the inquiry, viz.:

1. What difference did the same large bars of unwrought iron afford to forces of tension and of compression, when prepared by rolling, or by hammering under the steam-hammer?
2. How much weaker, per unit of section, was the iron of very massive hammer forgings, than the original iron bars of which the mass was composed?
3. What was the average, or safe, measure of strength, per unit of section, of the iron composing such very massive forgings, as compared with the acknowledged mean strength of good British bar iron?

We have not space for the illustrative details, but the conclusions deduced were, that practically the iron of very heavy shafts, forged guns, huge cranks, and other similar masses, might be expected to become permanently set and crippled at a trifle above seven tons per square inch, and to give way by fracture at about fifteen tons per square inch by tension, and to completely lose form at pressures of from fifteen to eighteen tons per square inch. Therefore it followed that, allowing a deduction of one-half, as sanctioned by practice, from the elastic limits of tension and of pressure, for the margin of safety, the iron of such forged masses should not be trusted for impulsive strains exceeding about one and three-fourths tons per square inch of tension, and about four and a half tons per square inch of pressure, or for passive tensile strains of three and a half tons per square inch, or for passive pressure beyond nine tons per square inch.

IMMENSE IMMIGRATION OVERLAND.—A gentleman writes to the *Independent* as follows, from San Andreas: Within a few days several immigrants have passed through this place, destined for Stockton and different points of the San Joaquin valley. One family was obliged to stop here for a few days on account of sickness. They had five large ox teams. The company consisted of five brothers with their families. They left considerable stock up in the mountains, where they say pasturage is very good. They left Iowa on the 16th of April; had a very pleasant trip; passed several trains. They say that there is an immense immigration on the road to California this season.

ANOTHER STAGE LINE.—A semi-weekly stage line is to be started on Monday last from Nevada to Virginia City. The trip will be made in about a day and a half.

Assay of Gold Ores.

Minerals containing gold are assayed in precisely the same way as the corresponding ores of silver.

This metal usually occurs in a quartorze gangue, and is frequently associated with more or less iron pyrites.

To make an assay of auriferous quartz, a given weight of the sample to be operated on, is to be finely pulverized, and subsequently well mixed with litharge, carbonate of soda, borax, and an amount of powdered charcoal sufficient for the production of a button of lead of a convenient size for cupellation. The metallic button remaining on the cupel after this operation will contain the whole of the gold present in the ore, together with any silver that may be associated with it, as well as a certain portion of that metal derived from the lead of the reduced litharge.

In the case of poor ores, containing less than half an ounce of fine gold per ton, the silver derived from the litharge will frequently be amply sufficient for the purposes of inquartation; whilst for the examination of richer ores, the addition of a little pure silver, at the time of placing the button on the cupel, is often necessary.

When, in addition to gold, the ore contains iron pyrites, or any other sulphurised mineral, it frequently happens that the admixture of charcoal, or any other reducing agent, becomes unnecessary, and the fusion may be made with litharge alone.

When pyrites or any metallic sulphide, is present in large quantities, the sample must be first roasted until all traces of sulphur have ceased to be evolved, and then treated as in the case of substances not containing that body, but with the addition of a larger proportion of borax. It is, however, to be remembered that, when any of these compounds contain sulphur, it is of the greatest importance that the whole of it should be removed during the process of assaying; since otherwise, and more particularly in presence of alkaline sulphides, a portion of the gold would enter into combination with the slags in such a way as not to be separated from them by the action of metallic lead.

It may be proper here to remark, that although it is exceedingly easy to estimate with great accuracy the amount of the precious metals contained in a given specimen of ore, it is something more difficult to obtain a fair average sample of the total produce of a vein. When the gold is in a fine state of division, and equally disseminated throughout the gangue, this presents but comparatively little difficulty; but when, on the contrary, it is granular, and occurs in pockets and irregular deposits, the reverse is sometimes the case.

It is therefore of the highest importance, that whenever ores are to be assayed for gold the greatest care should be observed in taking the samples on which the operation is to be conducted. With this view, the heaps should be cut through, two or three tons being taken from each pile of importance, and reduced to fragments of the size of beans: this may be done, where crushing machinery is not at hand, by *bucketing* on an iron plate.

The ore thus prepared is now to be thoroughly mixed, made into a pile, and again cut through, taking out of it this time from three to four hundred weights, which are reduced to a state of fine powder, either in a large mortar, a small crushing mill, or by grinding on an iron plate. After well mixing, this powdered ore is again cut through, and about twenty pounds weight of it taken, for the purpose of being still further reduced in size and passed through a sieve of fine wire gauze; on this last from three to six different assays are to be made and their mean results taken as the produce of the ore examined. By operating in this way almost absolute accuracy may be ensured; but, where a less degree of exactitude is sufficient the quantities of ore crushed may be somewhat reduced and the number of assays fewer.

Fusion with Litharge and Carbonate of Soda, &c.—When the quartz does not contain an appreciable quantity of iron pyrites, or any other sulphide, weigh 2,000 grs. of finely pul-

varized ore, and carefully mix it with twice that weight of litharge, 2,000 grains of carbonate of soda, and from fifteen to twenty grains of finely powdered charcoal. Introduce this into a crucible, of which it should not occupy more than one third the capacity, and heat in an ordinary assay furnace until the whole is in a state of the most perfect fusion, when the crucible is withdrawn and allowed to cool. When sufficiently cold it is broken and the button of lead extracted and cupelled. This method for the assay of gold, is preferable to pouring into a mould.

Fusion with red Lead or Litharge.—When the sample of quartz operated on contains a sufficient amount of sulphide to reduce a convenient quantity of lead for cupellation, the assay may be sometimes effected by the addition of litharge or red lead only. In this case the oxide of lead must be employed in large excess, and 2,000 grs. of the ore may be fused with from three to four times its weight of litharge or red lead.

Auriferous Pyrites.—To determine the amount of gold contained in auriferous pyrites, the sample should be roasted until the odour of sulphur has ceased to be evolved. If, as in the former experiment, the weight originally taken be 2,000 grs., mix with 1,000 grs. of dry carbonate of soda, 1,000 grs. of red lead or litharge mixed with charcoal, and 1,000 grs. of dried borax; beat, and in other respects proceed as before.

Cupellation.—The cupellation of the buttons thus obtained is to be conducted as described under the head of assays for silver.

Inquartation.—In order to dissolve not silver by nitric acid from an alloy of gold and that metal, it is essential that the silver should exceed in weight about three times the gold present. It is consequently necessary that, when the amount of gold in the leaden button is approximately known, the piece of pure silver added should be of such a weight as nearly to satisfy these conditions. The only inconvenience, however, attending the condition of too large a proportion of silver, is the circumstance that the gold obtained by the subsequent action of acid is thereby rendered flocculent and somewhat more difficult to collect.

Parting.—The button remaining on the test, after cupellation, is first allowed to cool, then flattened with a small bright faced hammer on a steel anvil, and carefully cleaned with a hard brush. After being examined by the aid of a lens, to satisfy the operator that it is free from extraneous matter, the flattened button is taken between the jaws of a pair of pliers and dropped into a long-necked flask, of about two ounces capacity, containing nitric acid of about sp. gr. 1.25 and perfectly free from any trace of hydrochloric. The flask and its contents are now heated in a sand-bath, until all action on the metal has ceased, water is added, and the liquid carefully decanted off. A little more acid is poured on the assay, and again made to boil, water is added, and the liquid drawn off as before. The residual gold is now carefully washed by decantation, and finally turned, by a little careful manipulation, into a small porcelain capsule, where it is slowly dried in a water-bath, or by some gentle heat, finally ignited to redness, and subsequently transferred to the pan of a delicate balance, where it is weighed. By dividing the weight obtained by five, and comparing it with the assay table, the amount of fine gold contained in a ton of ore will be determined.

When the ore treated contains silver in addition to the gold, and it is desirable to estimate its amount, it becomes necessary to first cupel the button of lead without the addition of silver; the prill thus obtained is weighed, and its weight noted, deduction being made for the amount of silver derivable from the reduced litharge, which must be ascertained by another experiment. If necessary for the parting more silver is added, by folding the button together by a bit of pure silver in lead foil, and again cupelling. Lastly, the button is dissolved in nitric acid, and the gold weighed. The weight of silver present in the ore will consequently be represented by that of the button of alloy obtained from the first cupellation, less the united weights of the gold, and the silver yielded by the reduced litharge.

In conclusion, we cannot do better than adopt the words of Dr. Percy, who, in his published lecture on gold, when speaking on this subject says: "Above everything be particular in obtaining an honest and fair average sample. This is a matter of paramount importance, and of no small difficulty in many cases. But let there be honesty of intention, and this difficulty will be generally surmounted."

ESCAPE FROM A CAVE.—Near Alpha, on last Tuesday, two men, one of whom we learn is named McElroy, who were at work in a deep cut, were caved upon by a large mass of earth which covered them. Instant and active exertions were made by their fellow laborers, to unearth them, which were crowned by complete success in drawing both men out alive and almost unharmed. McElroy was slightly hurt in one of his arms. The other man had not a bruise.

FLOODING UP.—The bed of the Mokelumne river has filled up nine feet since 1849 that is, the level of low water is now twenty five feet below the level of the bridge; twelve years ago it was thirty-four feet. The Stockton Republican says: "The recent overflow was caused by the filling up of the river with deposits from the mining operations above, thus forcing the water out of its natural channel, during a freshet, over the bottom land."

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207 766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100 000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths. fine.....3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold coin refined for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
 301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$116-4-11ths cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BAR SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$116-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$116-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

PURE NATIVE SONOMA WINES.

RED, WHITE, AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on putting them into the market, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma. M. G. VALLEJO.

At the depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo, for specimens of his Wines exhibited at the various Fairs held in the different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by

A. S. LOWNDES & CO., Agents,
 176 Montgomery street, opposite Montgomery Block, San Francisco.

PRINTING OFFICE REMOVAL.

THE COMMERCIAL BOOK AND JOB STEAM PRINTING ESTABLISHMENT

Has been removed to the New Office,
 No. 517 Clay and 514 Commercial Streets.

Book Printing, Law Briefs, Catalogues, Business Cards, Hand-Bills, Circulars, Theatre Work, American Flags, Envelopes, Badges, Bills of Fare, Programmes, Posters, Legal Blanks.

We keep constantly on hand and for sale, an assortment of

NATIONAL FLAGS AND BADGES.

In beautiful and extensive variety. Sole manufacturer of the

NEW UNION ENVELOPE,

With original and Patriotic verses. Everybody should use it.

Our Office is complete and perfect in every respect, And we shall endeavor, in the future, to merit a continuation of that patronage which we have heretofore so generously received.

VALENTINE & CO., PROPRIETORS.

Please call and give us a trial.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the inferior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from sawt, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut Balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plater or runner of each set is provided with heaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the Smut Balls, Oats, Chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and draw up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals,—whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with a little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. S. LYERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

- 1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.
- 2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.
- 3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.
- 4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other, three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee, J. B. BEERS

HUNT'S

IMPROVED FIRST PREMIUM

WIND MILLS:

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 308 & 201 Jessie street,

SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware; all of this city.

PRICES.—Eight foot wheel, \$50; Ten foot wheel, \$75; Twelve foot wheel \$100 to \$125 ap19 E. O. HUNT, Builder.

UNDERTAKING.—The undersigned would most respectfully inform

their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street. nov3

33 Sacramento Street.

AGENCY FOR PATENTS.—The undersigned having been long es-

tablished in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Caveats and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,

Office, Market street opposite Montgomery

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS. DAN LYNNCH, 720 Montgomery st. op. Metropolitan Theatre.

The subscriber begs to inform the public that the above mentioned Billiard

Saloon is also intended to serve as a show and saloon for

Phelan's Patent Combination Cushions and Modern

Billiard T. bles,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables

BERGER'S BIJOU BILLIARD TABLES,

WITH PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition a

Phelan's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine it. The Great Master, Mons. Berger, speaks of the Tables in the highest terms of commendation. To private families these Tables commend themselves, especially on account of their convenient size and as an article of furniture for a private dwelling there is nothing more desirable; in short, no household or mansion with any pretensions to be well regulated, should be without one. Gentlemen about to build residences should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful, and health-giving game of Billiards.

M. E. HUGHES, Billiard Table Manufacturer,

And Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc.

Exhibition and Sale Room, No. 720 and 722 Montgomery street.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....SEPT. 7 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome Sts., by

J. SILVERSMITH, Editor and Proprietor.

A. First Class per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line

Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEROTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Ekes, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

Patrons will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

VALUABLE PAPER ON THE EXTRACTION OF GOLD FROM SULPHURETS OR IRON PYRITES.

[Delivered before the German Scientific Association.]

BY CHAS. RIEHN ESQ.

The readers of this Journal will remember that for the past six months we have had an advertisement in the Press from responsible parties in this State, offering a reward of \$5,000 for the practical method of separating gold and silver from the tailings and sulphurets, as found in the mines on the Pacific Coast. Thus far no one has offered to solve or lay before us a *modus operandi*, except the following elaborate document, which we translate from the German, by Chas. Riehn, Esq., whose mineralogical and metallurgical knowledge, we, as well as those who know him, do appreciate. The subject is one of importance, since millions of tons of these tailings or sulphurets are now lying waste and dormant, some of which are estimated to contain from \$500 to \$1000 per ton. He says:

Being a reply to the question: "Which is the most profitable method of obtaining the precious metal out of iron pyrites?"

The iron pyrites (sulphuret of iron) a combination of about forty-eight per cent. of iron to fifty-three per cent. of sulphur, sometimes, particularly in California, enclose a certain amount of gold combined with more or less silver. This species of ore, which by itself, if not valuable by the presence of precious metal, can only be used for producing sulphur, sulphuric acid, or sulphate of iron (copperas) and for smelting purposes, to secure the proper formation of slag or scoriae: the copper, lead and silver ore is never used to produce metallic iron. As regards the extraction of the gold from this combination, in which it undoubtedly is mechanically encased—not, however, chemically combined, the different so called "new processes," that have been invented and applied for the last ten years in this country, have not given any satisfactory results, at least, so far as a perfect extraction of the precious metal is concerned.

The most common treatment of the ore—the amalgamation—the quicksilver being cold or heated, could only successfully be applied, if each and every particle of gold and even the smallest possessed a clean metallic surface, so as to be easily absorbed by the mercury. As it is, however, a great many of these particles being covered by a film of ore, resist amalgamation; to remove this covering would, in fact, be the solution of the problem, if it were not for the necessary expensive ingredients, and also for the waste of time. A re-roasting, re-pulverizing and re-amalgamation of the ore has never shown any satisfactory result, not even when repeated several times.

One of the latest improvements to separate the gold from the iron pyrites, has been invented by Assayer Platner in Freiberg. The theory is that he produces chlorine-gas, and brings the same into contact with the pulverized roasted ore.

The chemical action of the chlorine is, that it converts the particles of gold into chloride of gold, which is soluble in water. A continual appliance of the latter in a boiling or hot state, will then dissolve and separate the chloride of gold from the ore, and consequently all the gold will be in a liquid form, provided the quantity of water used was sufficient. There are several substances which then would reduce the gold out of this solution, as for instance, metallic zinc, iron, copper, or the solution of copperas. The gold in this way obtained may be considered pure, the silver, however, which was originally alloyed with it in the ore, is considered lost, for it was left in the ore in the state of chloride which is insoluble in water as well as in acids.

This process, although good in many respects, offers, however some difficulties in its execution, which have well to be taken into consideration. At first, the chlorine-gas, on account of its poisonous nature, demands a great many precautions, requiring such a degree of attention as may easily be observed in a European laboratory, but not so well in California mountain gulches. Another important point by using this method in question, is the state of the solution that the gold is in, which in all cases is to be avoided, on account of the loss it is exposed to, and which it is almost impossible to prevent.

Besides the difficulties mentioned, this process requires considerable time, which may well be spent in Europe but not in this country, where time is considered more valuable than anything else.

The most profitable method, according to the experience and view of the author of these few lines, is in the smelting process, by mixing and working the iron pyrites with argentiferous lead ore, which sometimes contain gold; for its proper smelting it needs a certain proportion,—the presence of iron pyrites, as already above mentioned, even if it does not contain any precious metal. The product of this smelting process is in German called "Werkblei," (work lead) a combination of lead, silver and gold, because the lead on account of its chemical affinity, while being reduced and melting in the furnace, absorbs all the precious metals present. This absorption is perfect and no precious metal is left in the slag, if all the requirements of the process have been observed. To separate then, the lead from the precious metals is done in a test-furnace by a certain heat, where it is melted and exposed to a current of atmospheric air, from one or more blowers. The lead here becomes oxidized, runs off as litharge, and when finished the result remaining on the test-furnace is an alloy of silver and gold in the shape of a cake.

Inasmuch now, as California does not possess a proper smelting establishment of this kind, the shipment of iron pyrites from this country to Europe, and even after a partial extraction of the gold has been effected here, would no doubt prove advantageous.

Bogus Mining Project. Another Swindling Plan to Fleece the Uninitiated.

It is perhaps not generally known that regular plots and schemes are now practised upon many of our citizens, i. e. presenting fictitious silver mines in stocks, by a set of unprincipled scoundrels as ever invested our shores! Too many have already been gulled to require of us an explanation, how most of these schemes are carried on and how they are executed by these wily fellows. Our present statutes make no definite allusions to such crimes, hence these "confidence individuals" cannot be reached by process at law.

We have not all the facts and details complete for exposing one of these deeply laid plans to raise the wind with. The affair is one on a grand scale with its Presidents, Trustees, Secretaries, Incorporation, amount of Capital Stock, and extent of lead, on a gorgeous certificate of stock handsomely printed. It behooves us to warn our people to be on their guard, since there is not even the shadow of the "color" in the whole. It is hinted by our informant that it will at once be forced into the market, and sold at auction. Other and similar means, of such swindling operations are too often perpetrated in the very midst of mining districts.

Report of Tax Payers Protective Union.

If we err not the above institution, recently established in this city, has done much towards our cities interest: also in securing the election of good men in this last gubernatorial campaign. In the report before us, we see the means of many of our citizens as members: It is full of statistics and tables relative to Real Estate.

The *Expositor* contains a series of articles apropos to the times. It is one of the neatest and handiest monthlies on this continent.

The Miner's Gold and Silver Saver! By Letters Patent.

We have just sent on drawings, specifications, and applications for Letters Patent, to Washington, for the above apparatus. Among modern inventions and discoveries, we venture to say no other can compare for its complete and thorough application, and its general principles. The models of which we have duplicates are now to be seen at the office of this journal, and are open to the examination of those acquainted with metallurgical operations. In our opinion we must admit that it is the only one based upon strictly philosophical principles: overcoming all short comings of all the known amalgamating processes and methods. We are satisfied it must work to within five per cent., although it is claimed by the inventor that it will work the ore—iron pyrites or sulphurets, both Gold and silver to its standard value of precious metals. The machinery or apparatuses are simple and easily constructed, and not so expensive as most others. The inventor is now on his way to Esmeralda, where he is practically employing this invaluable process. Information, or purchase, or right of use may be effected with the Editor of this journal.

Important if True.

We are informed through reliable authority, that Adolph Sutro, now of Chinatown, N. T., is in possession of an amalgamating process, said to exceed many others already in the field. A short while since he obtained from Mr. Sparrow of that place, a quantity of iron pyrites or tailings, which he worked by this process and found to contain at the rate of \$350 per ton. Sutro we know has of late paid considerable attention to metallurgical science, and if we err not must have acquired considerable knowledge. There are thousands of tons of tailings in Nevada and Esmeralda Districts, and if his new method fails him not he may yet retrieve his lost capital, invested in the fabulously rich silver claims in that district. *non sereus.*

Scarcity of Mining News.

We are unable to give our readers this week the usual quantum of mining matters, since we have heard and seen nothing but Stanford, McConnell, Cenness, Bulkhead, Secession, Union and War. Verily, these are busy times. It is a lamentable fact, that the Pacific States should suffer from such deleterious and perplexing difficulties, when it may be said we have just began to realize that we are in the midst of new and richly diffused mineral possessions. How long we may be called upon to chronicle such sad catastrophes we are unable to solve, but we fervently pray that peace and harmony may soon be re-established, and allow our people to carry out their hopeful plans, and cause them to realize their most sanguine expectations.

Strength of Gun Metal.

"We were never so powerfully impressed," says the Liverpool *Advertiser*, "with the improvements in the manufacture of gun-metal as during a recent visit to the Mersey Steel and Iron Works, where we witnessed various attempts to burst a two-pounder gun. The experiments took place in a chamber excavated in the sandstone rock, covered over with loose sheets of iron, which, of course, made a considerable rattle when each explosion took place. The gun in question, which is five feet two inches in the bore, and weighs somewhere about four hundred pounds, after being charged with one pound of powder, was filled to the muzzle with one-pound balls and fired by means of a string. When the smoke had cleared away, it was found that the gun was all right, and that so great had been the force of the explosion that many of the shot were shattered, and others deeply buried in the rock. The gun was again charged, and filled with balls, and a cylinder, or round bar of iron, which projected from the mouth. It was then fired, with equally satisfactory results. The next trial was with one and a half pounds of powder and three cylinders, weighing seventy-six pounds altogether. This is a test which few guns are calculated to withstand; but though the noise of the explosion was very great, the metal of the gun was so tough that it remained uninjured. The weight of the metal was afterwards gradually increased to nearly ninety pounds, with safety."

We acknowledge the receipt of the advance sheets of Prof. Silliman's American Scientific Journal, New Haven, Conn. The Pamphlet treats of the comet, as described by the different observations both in Europe and the Atlantic States.

CALIFORNIA

Valley County.—Some Chinamen near Lewiston, have a claim on which they take out from twelve to fifteen hundred dollars a week.

Of the rationale of the Patio process many views have been given. All the older theories supposed the formation of a chloride of silver from the electro-chemical action of the sulphate of copper, salt and mercury on the ore—a doctrine which is now generally abandoned as being altogether untenable, and to be at variance with the truth, chloride of silver never being present except accidentally and in minute quantities (when not found in the ore) and rather impeding than facilitating the operation. It was observed by John A. Browning, an English gentleman, long resident in Spanish America, and favorably known for his practical and scientific knowledge of the reduction of silver ore, to propose a theory at once simple, intelligible, fulfilling all the requisites, and explaining all the phenomena of the "beneficio de patio." It is that the chloride of copper is formed in contact with the proto-chloride of mercury: by the action of this latter metal on the proto-chloride of copper present, this chloride absorbs an atom of oxygen from the air, being converted into an insoluble oxy-chloride, which dissolving in the access of salt, communiates its oxygen to the sulphur of the sulphuret of silver in the ore, with formation of sulphuric acid and metallic silver: then going back for another dose of oxygen to repeat the process at infinitum, until the pure metallic silver is separated in the form of a fine powder, and the residue is a sulphuric acid. Metallic silver being so abundant, the first step we need readily understand why in a well known

The Dallas Morning News contains the following correspondence from Pierce City, W. T., of date of August 20th: So far as population, wealth, and importance is concerned, we have now an area of 32,000 square miles partly prospected, or in other words, known to produce gold, and yet we have hardly commenced the prospection of the country. The country is too large to be completely explored, for, the spirit of enterprise cannot be stayed; almost all men in reference to this region—and \$5 or \$10 will not answer the expectations of ambitious explorers, whilst the country remains unexplored. There are about three hundred men prospecting and at work on this stream; thus it will pay good wages I am satisfied, from what I have seen. The country is mountainous, and the eye of the practical miner it denotes enough to find gold, and wishes.

Popular Mineralogy.

"Nor to the surface of enlivened earth,
Graceful with hills and dunes, and leafy woods
Her liberal tresses is thy force confined:
But, to the bowelled cavern darting deep,
The mineral kinds confess thy mighty power.
Effulgent hence the veiny marble shines;
Hence Labor draws his tools; hence burnished War
Gleams on the day; the nobler works of Peace
Hence bless mankind, and generous Commerce binds
The round of nations in a golden chain."

Thomson.

The study of Nature, in whatever direction it is pursued has been found to be productive of so much gratification and instruction, that when once the delight that it affords has been tasted by the reflective mind, the study is rarely, if ever relinquished. The interest taken in its pursuit continues, on the contrary, to increase in proportion to the increased knowledge that is required of the objects that engage the attention. Thus, the zoologist finds it a source of boundless pleasure and instruction, to watch the habits and economy of the beasts of the forest; to listen to the warbling of the varied feathered songsters that, perched on topmost bough, enliven the stillness of the morning air with their simple melodies; to observe the curious changes through which insect life must pass before the butterfly can flutter away its few short hours in unconscious splendour; or robbing the ocean of her molluscan inhabitants, to investigate their anatomical structure, whilst their beautiful shelly coverings be arranged in his cabinet.

Thus, too, the botanist, the further he advances with his examinations into the structure and organization of the flowers that

"Deck the valleys with unnumbered hues,
And far around their fragrant sweets diffuse."

becomes more and more deeply imbued with admiration of their exquisite beauty and infinite variety

But, whilst the study of living nature is daily becoming more generally followed and appreciated by all classes of society, the science of Mineralogy has not enjoyed that degree of popularity to which it is entitled, by the very great attractions it possesses for all who delight to recreate their minds, by the examination of the wonderful and beautiful productions of nature, and to investigate their various degrees of utility to mankind, in the progress of the arts, manufactures and sciences. This may arise from a variety of causes, of which the most apparent seems to be "absence of that life and the power of motion" which are the peculiar attributes of the animal and vegetable kingdoms, and which add such a charm to their study.

Those, however, who devote their leisure hours to the examination, even if merely superficial, of the mineral or inorganic productions of creation, will not fail to discover, that, though they possess neither life nor motion, Nature, as if to compensate for these deficiencies, has bestowed upon them with a lavish hand all that can render them attractive to the eye or suggestive to the reflection; and has not only decked them in the most gorgeous tints, but has endowed them with so much gracefulness and diversity of form that, in fact, their beauties are excelled by no other class of natural objects.

But mere beauty alone, though it might please for a time, would be insufficient to secure for them a permanent claim on the student of nature. We therefore find that, although their beauty is great, and quality sinks into insignificance when compared with their direct and vast utility as agents, which the perseverance and ingenuity of man has learnt to make subservient to his will, in carrying out the grandest and most elaborate mechanical designs that the human mind is capable of conceiving.

In another point of view, but little discrimination is necessary to perceive the importance of our science, very many of the elementary substances of which minerals are composed possessing medicinal properties, the judicious application of which, in the treatment of the infirmities of human beings, is an art only to be acquired by the most intense and unwearying course of study on the part of the medical practitioner, to whose skill and knowledge we entrust our lives.

The mineralogist, therefore, must not be satisfied with the mere pleasures of collecting and arranging in his cabinet a series of brilliant and well selected specimens, attractive by their beauty or their rarity, though this is absolutely necessary to a correct knowledge of the appearance and form peculiar to different substances; nor must his main object be to excite the envy or admiring praises of the friends to whom he takes a pride in exhibiting his collection; but making himself acquainted with their composition and properties, their modes of crystallization and the circumstances of their occurrence, his mind will become improved and refined by the contemplation of the perfection and invariability of the laws of nature, holding equally in subjection the organic and inorganic; and by studying the uses to which these mineral substances have been or may be applied, he arrives at the true end and legitimate aim of all scientific inquiries.

Mrs. Day's *Hesperian* with its varied amount of interesting subjects, including fashion plates, and an elegant frontispiece of General Scott, for Sept., lies before us. We commend it to the ladies.

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING,

.. BUT THE BEST FOR..

MANUFACTURING CLOTHING

.. AND..

OTHER HEAVY WORK.

SAN FRANCISCO, JUNE 1861

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Coats, and Tweed Suits, etc., from materials made at the Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them is not surpassed.

Various styles of Machines have been employed on the above, but the Wheeler & Wilson is preferred.

Proprietor of the Mission Wool Mills.

July 6

WEAR OF GOLD AND SILVER COINAGE.

Gazette of St. Peter-burg gives a curious account of experiment recently made at the mint of that city, for the purpose of ascertaining the comparative loss by the ordinary use of gold and silver coin. It appears contrary to the generally received opinion, that gold wears away faster than silver. The means employed were as follows: Twenty bars of gold half-imperials, and as much of silver specks, of about the same size,—were put into two new bar-machines like canons, which were kept turning for four months. It was then found, on weighing the bars, that the gold coins had lost sixty-four grammes, while the silver coins had lost only thirty-four grammes; but as the weight of gold pieces were twenty-eight per cent. less than of silver, the proportion is greater to that amount in the latter. It must however be mentioned that the gold contained more alloy than the gold, the standard of which being 868-1000ths of pure metal, and that of the silver 916-1000ths. The result of the experiment is, that the ordinary loss on the wear of gold coin is about thirty per cent. more than on silver.

CLIFFS IN CALAVERAS COUNTY.—These cliffs are on the west bank of the Stanislaus, near the Big Trees, and the basaltic formation, and have a prismatic structure regular as the work of art. Some columns are prisms of basalt, and thirty or forty feet high. They are about two feet high and almost perpendicular. Some places, however, they project fifteen or twenty feet, and about two-thirds the way down from the top is a table, on which the climber may climb and walk around the very face of the cliff. —Columbia Times.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machine, men of mechanical genius have been busily engaged in its improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supercede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at Los Angeles, Santa Clara county. The superior merits of this machine exist in the facts that, 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is less liable to get out of repair. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any way, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this valuable invention, and shall be happy to see or hear of any of them who desire to purchase county rights, or to purchase machines. Letters must be addressed to "J. Silver, Government House, San Francisco." We warrant our machine to give every satisfaction to purchasers. We also ready to negotiate with Agricultural Implement Manufacturers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June your newly improved Mower work, and, in our judgment, one of the greatest improvements that has yet come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided improvements.

Yours, truly,
G. W. HAMMETT, A. BALDWIN,
M. CROIGER, CHARLES McARRON,
D. R. MEACLAN.

June 12th, 1860.

STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harnett's field, and I am pleased with its performance. The cam wheel power over the cog wheel for driving a reaper knife, which I have decided upon, after consulting with farmers, on the score of economy, if for no other reason. There is a year compared to the cog wheel power, which gives out and becomes worn in two years or seasons. The cam wheel will be as good after twenty years. I have no doubt of its being the right principle of driving the knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging-bearings and hoxes, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying new reapers every two years.

Yours, with much esteem,

ELAN BROWN.

PACIFIC, June 23, 1860.

STANDISH—Sir: This is to certify that I have operated one of your reaping machines, and find it to be, in my opinion, one of the best machines I have seen work in this State. I also think that the draft is better than a cog wheel machine, and also that it will not clog in the knife bar, or cut any grass. G. F. BROWN.

LAFAYETTE, June 27th, 1860.

STANDISH—Sir: I saw your mower at work in down clover and oats, and it performed better than any other I have ever seen. Its simplicity, durability and lightness of draft, it certainly has not its equal. Respectfully, yours, WARREN BROWN.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our hitherto extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Muley, and Circular Saw Mills; Single Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these single machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Steam Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, } San Francisco

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing belt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munih & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts., 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made. For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the Inventors of the United States.

Frictional Gearing.

Frictional gearing is coming into successful use in Great Britain for all purposes, from small machinery up to the driving of the screws of steamships. Instead of one wheel driving another by the intersection or "mashing" of the "cogs" or teeth on their rims, the adjacent surfaces or faces of the wheels are grooved lengthwise, or in the direction of their motion, like the rolls of a rolling mill. These grooves are V-shaped, and the friction of the V's of one wheel against the sides of the V's of the other wheel is so great that the one drives the other as in the case of cogs. The friction of the journals of the shafts is somewhat greater than in the case of tooth gearing, but in other respects the frictional wheels seem to work most smoothly. The "back lash," or rattle of teeth, especially when worn is prevented. The chief economy is in first cost. The cutting of the teeth of gearing involves the application of abstruse mathematical principles; each side of each tooth is shaped to an epicycloidal curve, varying with the diameters of the wheels. The machines and processes required are expensive and numerous, especially in cases of beveled gearing. But the preparation of frictional gearing is the most simple and straightforward work of the turning-lathe.

An ancient skillet was washed out of a hydraulic claim, not long ago, on Brushy canon, several miles from Forest Hill, which certainly is quite an old relic. It was found in two pieces, one half being discovered two years ago, and the other half but recently. It was originally made out of lava, is almost as hard as iron, but now quite porous; it is circular, has a spout, the bowl is an inch deep, and has three feet underneath, two and a half inches long, with a neatly finished oval shaped bottom. It was discovered by John Pearson, who has left it at Mr. Scott's store, intending, we believe, to send it to the State Fair, as a specimen of crockery-ware used in the mines several thousand years ago.

DEATH OF THE DISCOVERER OF THE COMSTOCK LEAD.—The celebrated claim of which James Phinney, whose death occurred in the town of Nevada, on the morning of the 20th instant, was the discoverer, and which is now worth fabulous millions in hard cash, was originally sold for less than the price of a week's board and lodging at one of the principal hotels in Washoe, three months after its discovery. Like Marshal who discovered the gold at Sutter's Mill, and thus opened a new field to the enterprise of the work-a-day world, Phinney appears to have been limited to a small local reputation as the reward of his labors.

The immense exodus which is now on its route to Esmeralda, Mono, Coso, Nevada Territory, and other important mining districts, not a few of which are help mates wires, daughters, sisters, misses (both aged and juvenile) will find it a great source of comfort and convenience to provide themselves with the only best sewing machine of Messrs. Wheeler & Wilson, it is by far the cheapest, the fastest, most noiseless, neatest, and most complete for all kinds of work now in existence. See advertisement elsewhere.

MARBLE.—We notice that the citizens of our adjoining counties begin to realize the value of the vast ledges of marble which abound in this section of the State. It is time that the people of these mountains began to comprehend that the wealth of California does not consist in gold alone but that many other interests exist as important as the mining interest. The *Amador Ledger* says: Amador county can boast of as fine a quality of marble as can be found in the State. We are only surprised that more of it is not thrown into the market. If men of experience would engage in the business, we can see nothing to prevent them from being richly rewarded.—*Tuol. Courier.*

Neighbor Crane will except our thanks for files of interior journals. Crane is agent for some of the best papers in this State.

NOTICE.

TO SHIPPERS OF OIL AND WHALEBONE.

THE PACIFIC MAIL STEAMSHIP CO.'S steamers will, until further notice, receive Oil and Whalebone at Acapulco for transportation via Panama, Panama Railroad to Aspinwall, and thence by sailing vessels to New York, at the following rates through viz.
Oil ten cents (10c.) per gallon.
Whalebone, two and one-quarter cents (2¼c.) per lb.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR: VOLUME III.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefitted by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Rooms 20 and 21, Government House, Corner of Washington and Sansome streets, San Francisco.

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALONES, VIOLIN DOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SIX ROMAN STRINGS (four lengths and four tenets), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them THIRTY PER CENT. CHEAPER than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street.

A. W. VON SCHMIDT, Chief Engineer

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, SEPTEMBER 14, 1861.

NO 25.

Herewith we represent a wood-cut, showing the *modus operandi* of gold mining by tunnels, drifts and shafts, by the hydraulic method, and by the pick and shovel in shallow diggings. In the background of the sketch will be observed a water-lume, and near it a string of sluice-boxes, into which the miners are throwing auriferous dirt. To the left, some miners are tearing into the heart of the hill, with their water jets. Next to the right are others working with a "tom." Two more are engaged at the windlass, over a shaft which their hidden partners are sinking; and beyond them are two men shoving a loaded car along the tram-way, which leads from a tunnel in the hill—while in the foreground are others working the "rocker" and "and panning out."

The first implement generally used in California for gold washing was the simple pan. This was followed by the Georgia "rocker," which is now used very seldom unless by Chinese, with whom it is a favorite machine. It is very handy for prospecting, on account of its extreme portability. The next improvements were the short and long "tom"—a shallow box with a perforated sheet iron bottom (shaped somewhat like the letter V,) through which the water, fine dirt and gold runs into a sloping riffle-box beneath; the large stones being left upon said bottom, from whence they are shoveled away. The tom is of various lengths; from six to twelve feet as a general thing—and is in communication with sluice-boxes, into which the dirt is thrown by the miner, and thus swept down into the tom by running water. Nevada County is, we believe, entitled to the honor of working the first sluices—which have since been adopted everywhere. The sluice-boxes are each made of three pine boards, with three cross-slats (one at each end and one in the centre), of the open top. A series of these, resting upon posts or tresses, are fitted into one another, and are then called a "string of sluices." A slope or grade of three inches (more or less) is given to the boxes, and at the points where they fit into one another, they are "caulked" with old rags and tough clay, so as to prevent leakage. The tresses are placed under the head of every sluice-box, and thus also support the tail or end of the preceding box. Across the inside bottom of the boxes, near the head are tightly fitted slates about an inch deep. These are called "riffles" and here gold is caught, sometimes with and at others without the use of quicksilver. There are an indefinite variety of riffles used—but these are the simplest, and by no means the worst. As this is the most common mode of gold mining in this State, for persons without capital we will give a closer description of it, and matters connected therewith.

We will suppose that Peter, James and John are out on a prospecting trip. They have with them their picks, shovels, blankets and pan, besides their provisions, a frying pan and tin cups. They reach a creek, dig down for the bed-rock and reach it at a depth of 7 feet. Filling the pan with dirt, which gives one and half or two cents, and from that up to the surface, they find prospects gradually dwindling down to a mere speck—commonly called "the color." They are in luck, for these are good diggings. They stake off their claims—generally one hundred feet in length to each man, and the whole width from bank to stream. Peter at once starts off to the nearest town, to purchase sluice-lumber, nails, a sluice fork, an axe, quicksilver, and more provisions. Meanwhile James and John, dig a ditch to lead a "sluice head" of water from the creek to the head of their claims. Peter returns with the lumber, etc., and

CALIFORNIA MINING SCENES.

the ditch being finished (the water however not yet running in it), they make the sluices and set them (on the ground if it slopes downward sufficiently) and everything being in readiness, let on the water. Peter and James now commence on each side of the lower sluice-box to dig down to the bed-rock, throwing the dirt into the sluice. John is engaged in "stripping" or digging away the top dirt at some little distance ahead of his comrades, so that they will have a less depth of dirt to dig when they reach where he commenced. Now and then he looks down to the sluices, and if they are getting choked so that the water is running over their sides, he seizes the fork and forks out the rocks; if he thinks there is too much or two little water running in the boxes, he takes his shovel and proceeding to the head of the ditch, regulates the supply as he may desire, now and then too, he sprinkles quicksilver in the upper boxes. Thus they work until Sunday evening when they leave off digging for the purpose of "washing down" and cleaning up." John takes the fork, and proceeds to travel along the boxes from the upper to the lower ones, forking out the rocks, James and Peter assisting him by leaving out the largest with their hands. When the gravel and sand have been greatly reduced in quantity, James goes to the place where the ditch joins the creek, and at a signal from John shuts off all but a couple of inches of water. Peter then takes a brush and scraper, with which he brushes and scrapes the amalgam and black sand down to the riffles in each box. The water is then entirely shut off, and the quicksilver, amalgam and sand is taken carefully out of each riffle and dumped into the pan. It is then panned out, and the quicksilver squeezed through buck-kin or stout drilling. The amalgam thus expressed is retorted or placed in an iron pan upon the fire until the quicksilver coating has evaporated, leaving nothing but the gold. If James, Peter and John have worked hard during the week, they will probably feel pretty good about this time, when they see the golden result of their labor. The last operation is weighing the gold and dividing it—and whilst they are doing this, we will bid our quondam friends, adieu.

Two Washoe teams passed through this place yesterday, loaded with 10,200 pounds of silver ore. The drivers say the road is in splendid condition.

\$1,090,516 GONE.—The steamship Ori-zaba which sailed for Panama to-day, took out \$1,090,516 in trea ure on her list, while a considerable amount was taken in the hands of passengers. The total amount could not have fallen much short of \$1,250,000.

NEW VOLCANO IN WASHINGTON TERRITORY.—A volcano has made its appearance upon the summit of a mountain on Hood's Canal. The blaze could be seen from the decks of vessels at sea, and was accompanied by a rumbling noise.

HUMBOLDT ORE.—An assay of silver ore taken to Red Bluff, and thence to San Francisco, yields \$33 78 in silver to the ton with a mere trace of gold.

Water obtained from the Sodo Springs on the new Sacramento road to Yreka, above Red Bluff, makes a pleasant effervescent drink after being bottled.

Tobacco.

We observe with much pleasure that the culture of tobacco in this State has been attended with entire success. Both on the Mokelumne and Los Angeles county, where the experiment has been made, the result has been satisfactory, and we learn that agriculturists in those regions design extending the cultivation of this crop, which, they say, can be done more successfully than in the most favored localities on the Atlantic side. The plant grows thriftily, is not infested with the worm, and has apparently fewer drawbacks here, where the soil is properly chosen, than in Virginia itself. This is an item worthy of consideration. California is a great consumer of tobacco—in proportion to its population, probably no State in the world is more so. It can be produced here in sufficient abundance to meet the demand. We may by and by have the satisfaction of dropping another item from our list of imports, and keep the purchase money at home. The present is a very favorable moment for prosecuting this enterprise, while the production in those States which have hitherto been the great source of supply, is largely curtailed, and their stocks shut off from the markets of the world. Tobacco has already advanced materially, and judging from present appearances, is likely to maintain remunerative prices for a good while to come.—*Shipping List.*

CORPORATIONS.—Certificates of incorporation of the following companies have been filed in the State Office: Live Yankee Quartz Mining Company, Klamath county, capital stock \$14,400; divided into seventeen shares, San Francisco, San Mateo Railroad Company, capital stock \$4,000,000; divided into 40,000 shares. Stevens' Water, Mining and Milling Company, of Del Norte county, capital stock \$50,000; in 500 shares, Sacramento Pioneer Railroad Company, capital stock, \$300,000; number of shares, three thousand.

A melancholy and fatal mining accident occurred on Thursday of last week, on El Dorado canon, several miles above Michigan Bluffs. A worthy young man named John McCaffrey, was employed in a tunnel, in "drifting" when a large rock suddenly became loosened immediately above the young man, and in falling struck him upon the head, killing him almost instantly. He was only about twenty-five years of age.

Hydraulic Machinery.

Water has been employed as a motive power from the remotest ages, and has been applied in numberless ways to a variety of machines, some of which display much invention and ingenuity. Since the introduction of the steam-engine, both the science and construction of water machinery, have been to a considerable extent neglected. In our mines the application of water power has been mostly confined to wheels in which little refinement of construction has been attempted.

Water is a compound body composed of eight parts by weight of oxygen and one of hydrogen. It expands in bulk and decreases in density from a temperature of thirty-nine degrees Fahrenheit up to two hundred and twelve degrees, and below thirty-nine degrees it dilates and decreases in density until it reaches the freezing point.

Experiment has determined that water may be compressed about 1-46,500,000th part per atmosphere; a quantity so small that, practically speaking, water may be regarded as incompressible.

The varying density and volume of water, although small, should be borne in mind by those entrusted with the construction of hydraulic apparatus. If it be allowed to freeze within cast-iron pipes, and no means be provided to allow free expansion, destruction of the arrangement is sure to follow; since a cubic inch of water exerts within the range of its expansion a force equal to thirteen and a half tons.

Water is subjected to the same law of gravitation as other heavy bodies: but this must in practice be considered as applicable to a dense column or sheet of this fluid only, and not to be divided jet, which is much affected by the resistance of air.

In England and Ireland the average fall of rain is about three feet per annum, of which about two-thirds is evaporated, the remaining twelve inches ultimately finding its way to the sea.

A column of water 12 in. high, lin. sq. weighs 434 lbs.

A cylindrical foot of water " " 49.1 "

" " " " " " .02842 "

An imperial gallon " " " " = 277.274 inches.

A pound avoirdupois " " " " = 27.64 cubic inches.

A cubic foot (1728 inches) " " " " = 6¼ gallons.

A cylindrical foot " " " " = 4.895 imp. galls.

A cylindrical yard, 12 in. diameter " " " " = 14.6 "

" " " " " " = 28.26 cubic inches

The subject of *effluent* water has received considerable attention from engineers, and the following deductions have been the result of numerous experiments:

That the quantities of fluid discharged in equal times from different sized apertures, the altitude of the fluid in the reservoirs being the same, are to each other nearly as the area of the apertures.

That the quantities discharged in equal times by the same orifice, under different heads, are nearly as the square roots of the corresponding heights of the water in the reservoir above the center of the apertures.

That the quantities discharged in equal times under different heights, are to each other in the compound ratio of the areas of the apertures, and of the square roots of the height nearly.

That, on account of friction, the smaller orifices discharge proportionally less water than those which are larger, and of a similar figure, under the same head, and that, from circular apertures presenting less surface under the same area than other figures, they are most advantageous.

That if a horizontal tube be of greater length than the extent of its diameter, the discharge of water is much increased.

DEFINITIONS.

1.—A stream cut vertically and perpendicularly to the direction of the current, presents a transverse section.

2.—If a stream be supposed to flow in a new channel whose sides are vertical, and whose bottom is flat, with a breadth and sectional area equal to that of its real channel, we arrive at its *mean hydraulic depth*.

3.—The velocity in a river is most rapid in the middle of the upper surface of the stream, and gradually diminishes towards the bottom and sides of the channel. The mean velocity is assumed to be the central velocity of the transverse section, and the declivity is the rate of fall or descent in a given distance.

4.—When water issues from a small orifice in the bottom or side of a vessel or reservoir, it acquires a velocity which a dense body would acquire by falling from the horizontal surface of the water. This is called its *natural velocity*.

5.—The height due to the velocity of water issuing from a cistern or reservoir, is known as the *head of water*.

6.—The head of water in water-wheels is the distance from the surface of the water to that point at which it strikes upon the wheel.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For parting silver from gold when gold

is below 300-1000ths. fine. 3cts per oz.

" " from 300-1000ths. to 750-1000ths fine. 7cts " "

" " 750-1000ths to 950-1000ths " .14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce ½ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight

301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, ½ per ct. gross value of silver for making bars; also when gold is contained ½ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. ½ per et. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. ½ per et. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. ½ per et. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of ½ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

PURE NATIVE SONOMA WINES.

RED, WHITE, AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them into the market, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vines in Sonoma. M. G. VALLEJO.
At the depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo, for specimens of his Wines exhibited at the various Fairs held in the different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by
A. S. LOWNDES & CO., Agents,
617 Montgomery street, opposite Montgomery Block, San Francisco.

PRINTING OFFICE REMOVAL

THE COMMERCIAL BOOK AND JOB STEAM PRINTING ESTABLISHMENT

Has been removed to the New Office,

No. 517 Clay and 514 Commercial Streets.

Book Printing, Law Briefs, Catalogues, Business Cards, Hand-Bills, Circulars, Theatre Work, American Flags, Envelopes, Badges, Bills of Fare, Programmes, Posters, Legal Blanks.

We keep constantly on hand and for sale, an assortment of

NATIONAL FLAGS AND BADGES,

In beautiful and extensive variety. Sole manufacturer of the

NEW UNION ENVELOPE,

With original and Patriotic verses. Everybody should use it.

Our Office is complete and perfect in every respect, And we shall endeavor, in the future, to merit a continuation of that patronage which we have heretofore so generously received.

VALENTINE & CO., PROPRIETORS.

Please call and give us a trial.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is an excuse, with the present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and soil matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleaning grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plate or runner of each set is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zine or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the smut balls, oats, chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills, and report to their principals, whether the step of the Machine can be examined daily, its facility for oiling, its contiguity to wood, the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. To this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. SILVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his improved
AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars inquire of the Patentee,
J. B. BEERS

HUNT'S

IMPROVED FIRST PREMIUM
WINDMILLS!

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 203 & 201 Jessie street,

SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1869, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware, all of this city.

PRICES.—Eight foot wheel, \$50; Ten foot wheel, \$75; Twelve foot wheel \$100 to \$125. ap19 E. O. HUNT, Builder.

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000

IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.

The Books of Subscription are open at the office of Piche & Beyerque where the required first instalment of 10 per cent. will be received.

A SPLENDID OPPORTUNITY.

AGRICULTURAL MACHINERY.

As I have taken, for five years, a large portion of the State Prison Labor, for the sole purpose of manufacturing AGRICULTURAL IMPLEMENTS AND CABINET WARE

I offer for sale, at a Great Sacrifice, in order to close out my present stock by September First, 1881, the following articles:

TWELVE HORSE STEAM THRESHERS;

C. M. RUSSELL'S EIGHT AND TEN HORSE THRESHING MACHINES.

J. A. MITT'S GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND

TWELVE HORSE POWER, with all of C. M. Russell's Latest Improvements;

HAY PRESSES, REAPERS AND MOWERS;

EXTRA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE RAKES.

All of the above goods will be sold at the Lowest Prices, either for Cash, or good approved paper at a low rate of interest.

THOS. OGG'S SHAW.

je6 33 Sacramento Street.

AGENCY FOR PATENTS.—The undersigned having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Caveats and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,

Office, Market street opposite Montgomery

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS. DAN LYNCH, 720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and salesroom for

PheLAN's Patent Combination Cushions and Model Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and bulk, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for PheLAN's Patent Combination Cushions and Modern Billiard Tables

BERGER'S BIJOU BILLIARD TABLES,

With PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition a

PheLAN's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine it. The Great Master, Messrs. Berger, speaks of the Tables in the highest terms of commendation. To private families these Tables commend themselves, especially on account of their convenient size and as an article of furniture for a private dwelling there is nothing more desirable; in short, no household or mansion with any pretensions to bein regulated, should be without one. Gentlemen about to build residence should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful, and health-giving game of Billiards.

M. E. HUGHES, Billiard Table Manufacturer,

And Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc.

Exhibition and Salesroom, No. 720 and 722 Montgomery street.

Manufactory, Market street, opposite Orphan Asylum. jy13

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....SEPT. 14 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 29 & 31 Government House, corner of Washington and Sanson streets, by

J. SILVERSMITH, Editor and Proprietor.

At Fifty CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEROTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the Press will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

THE STATE FAIR.

On the 16th inst., the people of California will again assemble at the Capital, at its annual exhibition in Agriculture, Horticulture, Mining, Science, &c. The arrangements are of the highest order for its interim of only four days. An extensive cattle show, races, yachts, and other prize exhibitions, will form part of the programme, all of which will materially tend to while away a few days in admiration, wonder, enjoyment and pleasure.

The different fairs now being held at Stockton, Marysville, and other towns, will no doubt transfer their stock or other articles to this Mammoth Exhibition. We notice that many important rules and regulations governing this institution have recently been enacted, by which its continued prosperity may be effected. Heretofore many obstacles in a pecuniary point, had to be contended with: it is thought, however, these will soon be overcome, and as we ardently desire they should. As we are on the eve or dawn for a long-wished-for emigration to our peaceful shores, who come hither to develop our immense mineral resources, by dint of which this institution will swell its number of members; it will form a nucleus for all of those who seek our shores, and make them interested in our future prosperity. Aside from this the burden of its honourous expenses will be materially reduced on its present active and generous members, who have struggled for the past ten or twelve years in sustaining this present association.

Much credit is due to the present board of officers, particularly to the Corresponding Secretary, O. C. Wheeler, Esq., whose energy and efforts are universally acknowledged and appreciated.

We shall be in Sacramento on Tuesday to witness the Exhibition, and shall not fail in noting down its leading features. We hope to find the many new discoveries and inventions pertaining to mining, science and art, which come directly within our sphere. We hope to see also that suitable premiums are offered for such machinery or implements. We have in this State unassuming, modest but poor, inventors, whose genius might be stimulated by offering them a bonus. It has heretofore been neglected by most of our District Fairs. We suggest that the board, for its future exhibitions, make this a particular point, i. e., to offer a premium for the best pick, sluice-box, drill, water-wheel, crushing mill, steam engine, amalgamator—best process for separating ores, &c.

For our individual enterprise, we come in with the best mining work, entitled the "Miners' Companion and Guide," containing about three hundred pages, nearly one hundred illustrations especially prepared—having full treatises on modes of mining, timbering, manual of metallurgy, geology of California, placer mining, etc. Reduction of ores, both gold and silver, and a glossary of technical terms not contained in any other work extant.

Pacific Metallurgical Reduction Works.

The following named ores and their quantities were received at the above works for reduction, the results of which will shortly be given. The works are superintended by Mr. Fugne, an experienced metallurgist from France. Ores reduced in this establishment are worked to within five per cent.

Twenty-five sacks of ore from the Colorado Mining Company—about two tons; forty-two boxes from the Sheba Company, Humboldt, about five tons; one ton from Buena Vista Mining Company, near La Paz, Lower California; twenty-five sacks—about two tons—from Rothschild Lead Patagonia district; two tons of rock from Forest Hill; worked one ton Lucerne mining company rock. Assay gave gold, 750.50. Bar coined gold 750.52.

A Gigantic Quartz Mill.

We have just seen an immense quartz crushing mill, now in course of being finished at the Miners Foundry of Mr. Howland's patent. Its weight is about eleven tons, twelve stamps, will crush about eighteen tons of quartz, is destined for Washoe, and will be propelled by a twenty-horse power. The engines are also cast and finished at this foundry. This mill is one entirely made from new patterns with many new and important improvements. It will undoubtedly be the largest of its kind in that district. Freight having been materially reduced, machinery of this kind is now ordered massive and heavy; heretofore the great fault has been in the machinery being too light.

Our Brother in the Army.

We learn through private advice that David Silversmith, Esq., our brother, is in the U. S. Army, now quartered at Lafayette park St. Louis Mo., under command of Major Gen. Fremont of California.

We opine if the General has for the most part such good fellows as him, victory will attend him in every engagement. We wish both of them success, as they are valiant and deserving.

NEW GRINDING AND POLISHING APPARATUS—The New York Company are now introducing a new form of emery wheel, which bids fair to supersede entirely the ordinary mode of covering a wheel with glue and sprinkling emery upon it. The emery is incorporated with India-rubber and sulphur, and while in a plastic state is put into moulds, and submitted under great pressure, to a high degree of heat, according to Goodyear's patent for vulcanizing; this converts it into a solid granular mass, resembling granite or iron. It can be made of any desired grade of emery, and used dry or with oil or water. The wheels can be turned off in a lathe, running very slow, in the same manner as iron is turned, which will enable parties using them to turn the face of the wheel to conform to work of any irregular shape or to "true" them if necessary.

On the Numerical Relations existing between the Elements.

"The arithmetical relations between the equivalent numbers of the elements," says Mr. Lea, "are susceptible of at least an hypothetical explanation, on the supposition that the common difference in a series of elements may represent the equivalent numbers of a substance as yet undetermined, which, by its combinations in varying proportions, gives rise to the bodies constituting the successive terms of the series. The new analogies, on the contrary, are more difficult of explanation, by hypothesis. Their accuracy, sometimes absolute, renders improbable the supposition that they are mere casual coincidences.

The nature of these relations consists in this, that if we take two substances, and examine the ratio which subsists between the numbers representing their atomic weights, we may find in certain cases, that it is identical with the ratio subsisting between the atomic weights of two other substances, and so on through a considerable number of elements. The ratio between the atomic weights, for instance, of oxygen and nitrogen, is that of four to seven, so likewise is that between those of zirconium and potassium, potassium and barium with absolute exactitude. What renders this the more remarkable is, that all three of these last substances are striking exceptions to Prout's Law, that the equivalents of the elements are exact multiples of that of hydrogen: they all have decimals, zirconium 22.4, potassium 39.2, barium 68.6. Now, the ratio just mentioned gives these numbers with their decimals with perfect exactness. The same species of relation also exist between many other elements.

Again, the atomic weight of carbon stands to that of nitrogen in the ratio of three to seven, a proportion which is found exactly or approximately to extend to certain other elements. Apart, also from these more general ratios many elements may be elated together in double or treble pairs, such that the two elements in one pair stand to each other in the same numerical ratio as the two elements of a second or third pair, the two elements constituting each pair being more or less closely allied to each other in properties, though the pairs are not necessarily analogous with those with which they are compared.

For example, arsenic stands to antimony in the same numerical ratio as selenium tellurium, within an extremely small fraction, so that by multiplying and dividing we have:

Tellurium 64
Arsenic 75 x = 120, Antimony 120.3
Selenium 40

Our space does not allow further reference to the details of this paper than to give its conclusion, which is as follows:—

It is not easy to fix the exact amount of importance which attaches to the numerical relations up to this time ascertained to exist between the atomic weights of the elements. Some are, no doubt, mere casual coincidences, and relations remarkably exact and symmetrical may exist between the atomic weights of bodies which have no analogies in their properties; for example, we may take calcium twenty, selenium forty, uranium sixty, bromine eighty, mercury one hundred. Here the differences are not only exact, but all the subsequent numbers are multiples of the first, and this between bodies remarkably dissimilar in their properties,—a striking proof of the necessity of caution in inferring relations of properties as following from relations of number. But on the other hand, to reject the relations of number when accompanied by analogy of properties as unmeaning and unimportant, would be to err quite as much on the other side. When the received equivalent of an element forming a term in a well marked series, differs from that obtained by calculation, it naturally leads, as Professor Mallet has remarked, to suspect an error, and desire a redetermination. The fact that a group of elements allied in their chemical characters, may be arranged in a series having a common difference or a definite ratio between its terms, confirms the propriety of grouping those elements together, and such analogies may, in doubtful cases, assist us in arriving at a correct classification."

Current Events.

Silver discoveries are reported to exist in the Coast Range. . . . Mr. Auguste Remond, has in course of publication a work on the coal stratifications of Monte Diablo, accompanied with illustrations of shells and fossil remains (many of them new species), edited and published by the publisher of the MINING AND SCIENTIFIC PRESS. . . . The Miners' Companion and Guide will be ready in a few days. It will be indispensable to the miners, geologists, and those engaged in metallurgy and assaying on this coast. . . . Prof. J. D. Whitney, State Geologist, has returned on Thursday last from Nevada Territory. . . . John Cremous, Esq., former attaché of the Herald, is now lecturing at Platts' Music Hall, in connection with a splendid Panorama on exhibition, recently painted by three of our most famous artists. . . . Citizens should beware of new bogus mining schemes. As soon as all particulars reach us, we shall surely make an exposure of a particular one now on the tapis. . . . Pig iron is scarce in our market. . . . An extensive overland immigration is pouring into our State.

SUMMARY OF MINING NEWS.

CALIFORNIA.

See County.—The Courier furnishes this week the unjoined editorial facts: "We have often alluded to the rich tunnel and other mines in this vicinity, until we feared we would bore our readers with accounts of their richness. But when we consider that the mining interest in this region is so important in importance, and that in this neighborhood we have some of the richest in the State, we are only doing our duty to the public by occasionally referring to them. The water in the ditches is a rare treasure, which usually supplies the hydraulic miners, but of late the supply of water is so scarce that the year around to wash the dirt out of them; so that operations in this kind of mining is not the same as it was in the "dry season." The tunnels in the main upper which our towns stand from three to five hundred feet from the surface, according to the old and truly ancient deposits in every direction, a thousand to twenty-five hundred feet from the surface are left up to the night, and the sound of the little fallers, the clink of the pick, the scarp of the shovel, and the whistle and song of the jolly miner, reverberate ceaselessly in these dark subterranean passages which have been excavated to obtain the mighty fulcrum which moves the commerce and the world. Our distant readers can perhaps form a tolerable good of the extent to which tunnel mining has been prosecuted, when we state that at least one million of dollars has been expended in tunneling in a mile of Forest Hill, and many a lucky miner has returned to the surface with a fortune. At this time the miners of the Middle Fork are opening up the lower half of the bed-rock, and removing therefrom the auriferous deposits, like a faithful surgeon would remove with his scalpel an untimely disease from the human frame—for in the estimation of a great many, to allow the "dust" to remain in its primitive state is anything but a wise thing to do. It is better to trade or rather rather the form of which necessary comes languid, or slow in this "fast" age; and the latter being all the more like the fish—the miner is the scotchman, but the latter of the dust takes out for miles around him its way to the surface. Mr. Webster in our town, where we frequently see thousands of tons of it varying in size from the powder to the size of pumpkin seeds, like little like bullets—tell us in color from a dark copper to a bright beautiful yellow. Our beauty and variety of the gold found within ten miles around Forest Hill, we doubt whether there is any other locality in the State to excel it.

Claveras County.—The Stockton Independent publishes the following communication from Stag Run, in the above county, in reference to the difficulties of the copper mines of Henderson and his wife, Kate, who are now in a case about disputed mining ground examined and acted by Messrs. H. Hardy, Forsman and Pike, of Copperopolis, the other day, a piece above named. Henderson chose Forsman, Wale, and Hardy, Mr. Hardy was selected by the two chosen. Mr. Jeff. Galloway, appeared as counsel for H. Henderson. The affair is one of some interest, for miners, because of its forming a precedent that may affect future cases. The matter is this: Mr. Henderson, from Old Gold, in this county, located copper claims for a company of thirty some time ago, but at of confiding himself to the quantity of ground specified by the local regulations, he exceeded the limits therein prescribed as far as to the attention of the defendants, who "jumped" a portion of the ground. Henderson claimed five thousand feet northwesterly and five thousand feet in a southeasterly direction—in all nearly two miles. Without allude Henderson in the least, the other party "bulged in" at a point he did not admit of a full claim, claiming for Henderson's company on ground claimed, without making it in part here and a part there. Henderson's plea was ignorance of the local laws governing copper mines, intended for a full claim to each member of his company, and these, he denied the right of the others to divide his company's claims, he contended the right of others in like and appropriate whatever and he had embraced within his parties, and could not warrantably hold. Henderson was his right, in case of "jumping," to point out the place he held in his claim. They all claim the same ground, but Henderson had claimed too much, he was not any more entitled legally to particular part, than to any other part; and if they had claim to it, it was not his right to claim it. It was the illegal claimant's misfortune to claim a thing the only legal one to have his company's claim divided, or not to have sufficient ground left together for a full claim for his party. The decision of the arbitrators was in favor of Henderson, so it will be seen when a company, after their agents have been given the full claim, and the right, in case of interference on the part of others, to cut out their ground, leaving "jumpers" a small choice instead of first—Henderson is a good one. The above dispute occurred about ground contiguous to Marshall's store, three miles northwest of Telegraph City, and about ten miles west of Copperopolis.

NEVADA TERRITORY.

From the Territorial Enterprise we clip the following interesting items:—
El. Rutherford, just in from the Humboldt District, informs us that in the Vista District, about fifteen miles south of Prince Royal Canon, seven different gold-bearing ledges have been discovered, and work is being prosecuted on all of them. There are about forty men at work there now—
 (1) in abundance is found about one mile from the diggings, and a splendorous stream of water runs through the entire district. The water is so hot that it will yet astonish the incredulous ones in this section. The El. Rutherford Company at Washoe find it necessary to enlarge their works on account of the increase of their business. They are accordingly adding an addition to their works 60 by 100 feet, and intend putting up an engine, of 100-horse power, and 100 pans, for working the South process, etc. The company for the past five months have been doing an excellent business.

El. Rutherford & Co. Now we understand that the Mammoth Lead in Eagle District, paying handsomely. Several parties advertise to carry passengers to El. Rutherford & Co. Messrs. Booth & Co., formerly of Butte, Calaveras county, have commenced the construction of a quartz mill in Seven Canon. They have brought their machinery, lumber, tools, grub, etc., to California. We presume that the company expects to be a self-sustaining institution. Messrs. Land, Peterson & Co., in the same county, have begun to build nearly completed. Staples & Co., of Gold Hill, have a new mill nearly finished at that place. It is named the "Union Mill."

Its owners intend to try the Washoe process in it. The California Company are now taking out about three tons of choice ore per week, which is shipped to San Francisco for reduction. They expect to realize much from it by next spring to construct a mill. The inferior quality of the rock is thrown aside for the present. The lead is now worked from lower tunnel, and in from two to six feet in width. Twenty-eight men are employed by the company, and the mine is doing well. The large owners in the claim, have recently purchased twenty-five feet more. Owners are confident that their claim will vie with the richest on the 100 when it is worked on as large a scale as some of the others. During the past twenty-six days the Spanish Company have crushed 152 tons of rock, obtaining from it \$44,000, or about \$280 per ton. This company is paying a better dividend than any other in the Territory.

El. Rutherford & Co. Now we understand that the Mammoth Lead in Eagle District, struck the ledge about one hundred feet below the surface, and are taking out silver rock which assays from \$200 to \$400 per ton. The lead is of enormous size. Quite a number of other ledges, which promise to be valuable, are also found in that District. The Cook Brothers, who have just returned from the copper mine recently discovered in Genesee Valley, give us some interesting particulars concerning it. The ore is found in a crystallized quartz ledge about five feet wide, the vein of copper is about two feet in width—the balance of the lead contains some gold. The copper ore assay from 70 to 80 per cent. of copper. About twenty-tons of ore have already been taken out, and the company will either sell, or commence operations on their own account in a short time. The claim of these best acquainted with that region is that the entire range in that region will prove rich in various kinds of mineral. The Nevada Silver Mining Company, who struck their vein of silver at Nevada, have not been doing much in their claim for the past six months. They have completed the retrimbering of their tunnel and are sinking on their old, taking out some very fine ore. The Company already have about tons of rock which will be crushed by the custom mills, as they do not intend to build their works until Spring. Charley Ewing, who is Robert's Creek, on the Overland Route, informs us that the Indians in

that section frequently make their appearance with fine specimens of gold, which they obtain in the neighborhood of that station. It is of the opinion that extensive mines will be found in that section of country.

We notice that some enterprising individuals are constructing a foundry between Gold Hill and Silver City. This will supply a much needed want in this Territory. The present rate of freight from Nevada to Virginia City, for small lots, is four cents per pound. The Polson Telegraph says that on Monday last, fifteen thousand pounds of silver ore, from the Central Company, Virginia City, were sent to San Francisco through the Polson Forwarding House of W. L. Perkins.

MONO DISTRICT.

The Tolammet quarter, in its scientific bulletin, by "Cosmorama," gives the following graphic sketch of Monoville: Monoville is a long straggling town, and will eventually be washed down into the gulch by the miners. The following is a list of the occupations, etc., of its citizens, viz.: 1 basket maker, 1 butcher's shop, 2 Justices of Peace, 1 doctor, 1 blacksmith, 2 shoemakers, 2 express offices, 3 livery stables, 10 mining and grocery stores, 16 saloons and whiskey shops, 1 mining recorder's office, 2 blacksmiths' shops, 3 bakeries, 1 literary depot, 1 barber's shop, 6 restaurants, 1 quartz mill, 1 tinner, 1 daguerrotypist, 7 hydraulic, 10 families, and 6 colored men. In relation to hydraulic at this place, I find that Joe Cook, of Springfield, is interested in the largest water power in the Mono District, E. Early & Co., own the largest, which is situated on an old channel of Monoville Gulch, and is very deep. This claim is one of the most interesting features of mining in Monoville. Last year there was only one hydraulic in operation. Besides the hydraulics in successful operation, there is another one in process of erection.

In regard to the statistics about stores, we find the rule holds good in regard to the enterprise of the Tolammet bays, as in all other places. Seven stores are owned by citizens of Tolammet county, two by citizens of Mono county. In the population of Monoville is far more than in any other place. But still the Tolammet proportion is largest, Mariposa next, and Tulare next. The balance is trifling from other portions of the State. After a tedious period of expectation, the miners were gladdened, on the first day of August of this year, by the arrival of the water in Monoville, from Walker's River, a distance of 13 miles. Henceforth the new ditch company will always have an abundance of water, and henceforth they only brought the surplus water of Virginia Creek into Monoville, and when the water began to fall the old ditch company claimed the right to appropriate the whole of the water of that creek. C. E. Preble, J. C. Goodman & Co., are putting up a large flume 36 inches wide, and 36 inches deep at the junction of all the gulches, which run towards Mono Lake. They have already completed between 1,000 and 2,000 feet of it, and intend next year extending it to the Lake itself, distant from its termination about eight miles. In connection with this flume, the following accident occurred. A squaw whilst crossing flume, lately had down stream, and before she was likely to recover. As a general thing I am sorry to say that the miners are not doing well—probably not getting more than grub; that they are tolerably certain of getting. The quality of the gold is the fault. On this side of the mountains, the same bulk would be worth from two to six times what it is in Monoville; however, some claims pay very largely. Six or seven, above the Falls, pay very well, averaging from \$50 to \$200 per week. Below the Falls, the claims are not so good. Mr. McNary owns a claim, which they take out daily from \$150 to \$500. Besides this, the flume claim of Messrs. Preble, Goodman & Co., before mentioned, may be reckoned as one of the best paying in Monoville.

ESMERALDA.

The following items are extracts from a letter to a gentleman at Placerville, at Aurora. The editor of the Placerville Republican has seen and examined the specimens referred to, which are now on exhibition in the above place: "I send you a few specimens from the Garibaldi lead, taken out at the depth of twenty-five feet. Some days ago twenty-seven tons were crushed which were taken out at a depth of from ten to twenty feet. The quality of the gold is steadily increasing in richness, and these specimens are exceedingly rich in silver. This kind of rock would probably yield \$100 per ton, and where mills are erected that will save silver and gold, too, the yield will be much greater. Our claim in the Western extension, on which I have taken a contract to take out five hundred tons shows quite as well as the Garibaldi lead at the same depth. In the course of two weeks, we shall begin to crush. Several men who have been here from Gold Hill, say our rock is better than Gold Hill was a year ago. In the Tennessee tunnel is now in the ledge, and some rock has been taken out said to be equal to any in the district. The ledge, as far as they have gone down on it, is from twelve to fifteen feet thick, which greatly increases its value. Green & Culver's mill here, is a perfect success now, having added Varney's amalgamating pans, by which means pretty nearly all the pure gold is saved, which was not the case when it was first started.

OREGON.

The Statesman says that the prospecting party have returned from Meek's Cut-off, and report favorably. Seven men from Marion county—Mr. H. Smith, James Smith, W. W. Cranston, Milton, Clinton and Rodgers—spent four weeks in their search, and on their return, met a party from Clackamas county with a supply of provisions. A portion of the two parties, consisting of Meek, Clinton, Rogers and Adams, and another from Clackamas county followed the old trail back to a place answering to McNary's account. They saw quartz in abundance, but were deterred by the Indians from prospecting on the creek. They dug down in a neighboring ravine, however, and found a fair prospect of gold. Considering they had sufficiently verified McNary's statement, and found the place, they took no further risk with the Indians, but made their way to the Willamette. Some \$20,000 in gold dust was brought down on Friday, the 23d, by Tracy and Co.'s Express, from the Nez Percé mines, besides a large amount in the hands of the passengers.

SASKATCHEWAN DISTRICT.

A recent exchange has the following important item: Messrs. Love and McLean passed through our town last week direct from the mines on the north fork of the Saskatchewan River. They brought seventy-four ounces of the dust, which has been forwarded to New York by Messrs. Burbank & Co. From the mine and from a letter which we have been permitted to see from a member of Messrs. Burbank's firm to their house in this place, no doubt is less entertained of the fact that gold exists in quantities that will pay for working, for four or five hundred miles along the north fork of the Saskatchewan River and its tributaries east of the Rocky Mountains.

LAKE SUPERIOR.

The Ontonagon (Lake Superior) Miner states that the representatives of the French company have been making investigations among the mines of the Ontonagon District in relation to the establishment of smelting works. The fuel used will be wood. In the Isle Royale mine, turned out sixty-five tons of copper, the Franklin mine, the Pewabic eighty-five, the Quincy one hundred and forty, and the Huron, Hancock, and Portage twenty-two tons, making an aggregate of 336 for the month.

WASHINGTON TERRITORY.

The Oregonian publishes reports of the discovery of gold on the head waters of the west branch of the Malheur river, about ten days' travel from Tygh Valley. Rich discoveries are reported. The party remained until their provisions were exhausted and the Indians became very hostile. These mines are near the divide of the Malheur and Des Chutes rivers, where the Meek Emigrant Company reported they picked up gold in 1815.

COLORADO DISTRICT.

Messrs. Jas. Meredith & Joselyn, of Sonora, arrived in this town on Sunday, and report unfavorably of a portion of the Colorado country; but of the rest they speak in the highest terms. Meredith's company have discovered a lead on the banks of the river, which prospects equally as good and looks exactly like the celebrated Constock lead of Washoe.

COSO DISTRICT.

Quartz operations are being carried on with great spirit and enterprise at Coso. There are about twenty arrastras at work in the vicinity. One quartz lead, about twelve miles east of Coso, worked by arrastras, turns out \$20 to the ton.

Collecting Minerals.

The following account of a short journey amongst the Cumberland mountains, in search of minerals, was kindly furnished to us, by Dr. B. Wright, of Liverpool, who has for many years been in the habit of personally collecting the mineral productions of those mountains, and through whose exertions many rare and beautiful minerals have been introduced into the cabinets of amateur collectors, which otherwise would probably have rested for ages in their dark security, unknown to the eye of science. On this occasion Mr. Wright acted in the capacity of guide to a gentleman well known in the mineralogical world, who, not content with the mere possession of a most splendid collection of minerals, was prompted by his enterprising mind to seek them in their native fastnesses amongst the mountainous scenery of Cumberland. As far as practical we shall relate the particulars of the journey in the words of Mr. Wright: "In the summer 1847, a Mr. C. being desirous of visiting the localities of some of the rare Cumberland minerals and personally inspecting the mines, made arrangements with me to accompany him as guide. This, I must observe, is absolutely necessary to a stranger visiting this district, for, though solitude is, perhaps, preferable, if the object be only to admire the splendid scenery of the place, a stranger in search of minerals might walk and search about for a very long time, and completely tire himself out, and would probably return as wise as he started, as to the precise spots where minerals worth having were to be obtained or the roads leading to these spots. A few days afterwards Mr. C. arrived at Liverpool, whence we took the rail to Penrith, at which place we hired a vehicle, and fairly started on our journey. Mr. C. promising himself a rich harvest as its result. Before we had reached half way towards our destination, the night had far advanced, and the silence was unbroken, except by the hooting of the wood owl and the flapping of the wings of the water-lowl, which inhabited the numerous lakes and pieces of water that we passed on our road. Taking our route by the river Caldew, and turning to the left, we came in sight of a small but compact village, called Hesketh Newmarket. When we reached it, the hour was so late, that all of its inhabitants had retired to rest, and were buried in deep repose: not voice was heard nor the twinkling of a light to be seen. However, we had previously settled to remain at this village for the night, and now found that our long drive, and the cold winds that we had encountered, had not disposed us to alter our determination. Pulling up, therefore, at the first inn we came to, and knocking lustily at the door, the landlord soon made his appearance; and after his first drowsiness had worn off, we found him to be a very cheerful entertainer. Not less welcome was the supper he provided; and if Mr. C. had felt somewhat dispirited at the commencement of his trip, his meal, and the few hours of sleep of which he afterwards partook, under this hospitable roof, served to renew his ardour and to recruit his strength.

Early next morning we proceeded on our journey to the mountains on foot, as horses or vehicles would have been of no service to us here. After walking some distance over hills and dales, we sat down to rest; and now we beheld a phenomenon, ordinary enough in itself, but which is seen among these beautiful mountains to the greatest advantage; I allude to the rising of the sun. Having watched it as it seem gradually to emerge from the German Ocean, and then burst upon our sight in all its brightness and gorgeous hue, we resumed our way, and, after toiling on for five or six miles, halted at the first mine.

The entrances to the mines are much like doorways, four feet wide and seven feet high, rounded off at the top; the mine generally runs into the side of the mountain on a level, and these passages extend to very great distances. All the metal is drawn out on a railway, and the operations of crushing, grating, washing and smelting the ore are carried on outside. We did not, however, enter this mine, as there were others in which we expected to be more successful, but contented ourselves in examining what the miners had brought out, amongst which we found several interesting minerals and even some which were unknown to us. This success gave Mr. C. renewed courage to proceed on his enterprise, which now indeed became necessary, as our difficulties and dangers increased. We now reached a very narrow footpath which led us over dangerous and stupendous precipices. This footpath was made expressly for the miners to bring out the ore on the backs of asses and small ponies. I have seen as many as twenty or thirty, one after another in a line, as it is not possible for two to go abreast, the width of the path not exceeding two feet.

Having proceeded along this path some distance, we at length arrived at the mine called Roughtengill, which is well known to have been formerly worked by the Romans, whose mode of working differed from the modern, for they used to heat the rock and then throw water upon it, which would burst it in many directions. I knew that we should probably meet with some good things in this mine, and we therefore concluded to examine its interior, and having prepared our lights to guide us whilst penetrating its depths, proceeded onwards. We found the sides and roof of the passage very jagged and rugged, as is often the case, but I cannot say that the lights of our candles were reflected back by a thousand crystals or stalactites, which Mr. C. had evidently expected; on the contrary, the surfaces around us had a very dirty and dull appearance, and the path was so deep in mud, that we had some difficulty in making any way. In order to enlighten

Silver.

Silver was first coined by the Lydians, some say; others, by Puidon, of Argos, 869 B. C. At Rome it was first coined by Fabius Pictor, 269, B. C. Used in Britain 25 B. C. The Saxons coined silver pennies, which were 22 grains weight. In 1302 the penny was yet the largest silver coin in England.

The scarcity of silver in Western Europe, including Great Britain, and in this country, has given rise to the question, Where does the silver go? In connection with this question, we make the following extract from a paper read by Prof. R. H. Walsh, of the Dublin University:

At the time when Pliny termed it the sink of the precious metal, silver was a favorite article of export to the East. It has continued so since, but the trade of late has assumed an extraordinary magnitude. In the years prior to 1856 over \$110,000,000 worth of silver have been exported through England alone, and from other countries a similar movement has been in operation. The export in 1825 was \$32,000,000, and this year (1856) it is proceeding at the rate of over \$45,000,000 per annum, judging from the returns that have been published for the first four months. Unlike the old movement the present cannot be permanent. The former was seldom more than might be accounted for as the distribution of silver to some of the chief consumers—the nations of the East—according as new supplies were raised elsewhere. It was, in fact, the ordinary movement from the producer to the consumer. Humboldt estimated the annual production of silver in Mexico at 1,184,000 lbs., or about \$25,000,000.

But now silver goes faster to the East than it is produced throughout the world. Hence the process cannot be permanent, but must come to an end as soon as the re-distribution of the old stock has been effected: for the annual production of silver is only about \$40,000,000; and since the export to the East through England alone is at the rate of over \$45,000,000, it follows that it cannot be the new supplies of silver which meet that demand and all others for the same metal, but that there must be some auxiliary fund to be drawn from. Such a fund is furnished by a cessation in the demand for silver in several countries which before used it mostly largely, but now use gold instead. Silver which used to be coined in France and the United States at an average rate of twenty million dollars per annum, is now little employed, while much of the old coin of that metal is melted down and exported. In France it is said that in one year (1853) so much as sixty million dollars were disposed of in this manner, and that the operation has been since proceeding at a still greater rate. In Mexico there are eight or nine mints, one of which is national, having one general law of coinage, but independent of each other, and subject to no general control. There are some characteristic differences in respect to grades of fineness and accuracy, but they seem not sufficient to call for a distinction, as the only external means of identifying is in the mint mark.

Frictional Gearing.

Frictional gearing is coming into successful use in Great Britain for all purposes, from small machinery up to the driving of the screws of steamships. Instead of one wheel driving another by the intersection or "mashing" of the "cogs" or teeth on their rims, the adjacent surfaces or faces of the wheels are grooved lengthwise, or in the direction of their motion, like the rolls of a rolling mill. These grooves are V-shaped, and the friction of the V's of one wheel against the sides of the V's of the other wheel is so great that the one drives the other as in the case of cogs. The friction of the journals of the shafts is somewhat greater than in the case of tooth gearing, but in other respects the frictional wheels seem to work most smoothly. The "back lash," or rattle of teeth, especially when worn is prevented. The chief economy is in first cost. The cutting of the teeth of gearing involves the application of abstruse mathematical principles; each side of each tooth is shaped to an epicycloidal curve, varying with the diameters of the wheels. The machines and processes required are expensive and numerous, especially in cases of beveled gearing. But the preparation of frictional gearing is the most simple and straightforward work of the turning-lathe.

ATMOSPHERIC WASHING-MACHINE.—At the last meeting of the Association, Mr. J. Fisher called attention to a new washing machine, the action of which was derived from streams of air forced through water from below—the most effectual temperature of the water used being about one hundred and forty degrees Fahrenheit. It was stated that machines on this principle, driven by steam power, had been for some time, in successful use, in manufactures in England, for cleansing soiled laces.

MINING COMPANY.—The Utah Mining Company filed its certificate of incorporation in the State Secretary's office, on the 6th instant. The company's claim is located in the Esmeralda District. Capital stock \$400,000; divided into 1,600 shares.

PACIFIC MAIL STEAMSHIP COMPANY'S line to PANAMA, connecting via the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company, at Aspinwall.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Ohio and Buckeye Co. Argentine, \$12.

PIONEER RIDING ACADEMY

LIVERY AND SALE TABLES,

Nos. 207 and 209 Montgomery street, one door from Jackson, San Francisco

ORRICK JOHNSON

PROPRIETOR.

Horses kept on Livery.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

Nov 3. All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street.

MASSEY & YUNG.

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE HEREBY fully informed that their NEW BILLIARD SALOON, with EIGHT CLASS PHELAN'S TABLES, will be opened for business on SATURDAY 29th, 1861. The undersigned respectfully solicits the patronage of a few Billiard Players, and hope by conducting their Saloon in an unusual manner, to merit their continuance and support.

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING

...BUT THE BEST FOR...

MANUFACTURING CLOTHING

...AND...

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, etc., and Tweed Suits, etc., from materials made at the Mission Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them is not surpassed.

Various styles of Machines have been employed on the above materials, but the Wheeler & Wilson is preferred.

DONALD McLENNAN,

Proprietor of the Mission Woolen Mills.

July 6.

Minor's Gold and Silver Saver! By Letters Patent.

We have just sent on drawings, specifications, and applications for Letters Patent, to Washington, for the above apparatus. Among modern inventions and discoveries, we are to say no other can compare for its complete and thorough application, and its general principles. The models which we have duplicates are now to be seen at the office of this journal, and are open to the examination of those acquainted with metallurgical operations. In our opinion, we submit that it is the only one based upon strictly philosophical principles; overcoming all short comings of the known amalgamating processes and methods. We satisfied it must work to within five per cent., although it is claimed by the inventor that it will work the ore—iron pyrites or sulphurets, both Gold and silver to its standard of precious metals. The machinery or apparatuses simple and easily constructed, and not so expensive as others. The inventor is now on his way to Esmeralda, where he is practically employing this invaluable process. For information, or purchase, or right of use may be effected with the Editor of this journal.

MEASURING FAUCET.—Whitman's measuring and registering faucet is simply a force-pump with a solid piston operated by a lever or crank. The cylinder is of the capacity of one measure (pint, quart, etc.) and at such discharge on a dial-plate moves forward one degree. Mr. Whitman thinks this invention will supersede the use of funnels, measure stores, abate the nuisance of flies about molasses barrels, and detect frauds in the capacity of barrels. The faucet made of cast iron, and capable of measuring quartz, and for four dollars.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supersede all others at present in use. Invented or is Mr. P. H. Standish, at present residing at Jose, Santa Clara county. The superior merits of this machine exist in the facts, that, 1st—It is capable of doing the work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of the invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or the machines. Letters must be addressed to "J. Silverthorn, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen in the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Calm Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

Yours, truly,
G. W. HAMMETT, A. BALDWIN,
M. CROIGER, CHARLES MCARRON,
D. R. MEACHAM.

June 12th, 1860.

P. H. STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday morning; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting out in Mr. Harner's field, and I am pleased with its performance. The cam wheel power over the cog wheel, for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present wheel plan. It saves all the wear and tear of cogging bearings and boxes, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,

ELAM BROWN.

PACIFIC, June 23, 1860.

P. H. STANDISH—Sir: This is to certify that I have operated one of your new machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife clover, or eat any grass.

G. F. BROWN.

Witness: Washington A. Wilson, W. T. Hendrick.

LAFAYETTE, June 27th, 1860.

P. H. STANDISH—Sir: I saw your mower at work in down clover and oil, very heavy growth, and it performed better than any mower I have ever seen. Its simplicity, durability and lightness of draft, it certainly has not its equal.

Respectfully, yours

WARREN B. AEN.

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This Mill will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Minor expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

SPRING VALLEY WATER WORKS CO.

S. E. corner Montgomery and Jackson sts., San Francisco.
WATER! WATER!! WATER!!!

Water will be let into the pipes of the Spring Valley Water Works, this afternoon, (July 19) in addition to that heretofore let out, in the following streets:

In Brannan, from the corner of Harris to Third street. In Third street, from Brannan to Townsend. In Third street, from Brannan to Folsom; including South Park. Also, from corner of Third and Harrison to Harrison and Fourth streets. All parties desirous to have the water introduced into their premises will please make application for the same, at the Office of the Company. jy20 A. W. VON SCHMIDT, Chief Engineer.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND POPULAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be hauled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing. KNAPP, BURELL & CO.,
apl9 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Mann & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the Inventors of the United States.

PAINTS, OILS, GLASS, PUTTY, BRUSHES, etc. etc.

321 Clay street, San Francisco.

his spirits, Mr. C. commenced whistling, which to my regret, I was compelled to check, as the miners are very superstitious respecting the practice of whistling in the mines, considering it a forerunner of some great evil.

Before we had proceeded very far, our progress was entirely stopped by the falling in of a portion of the roof, but by dint of great exertion, we removed the soil and rendered it possible. Having now traveled some two hundred and forty fathoms underground, our toil was in some degree rapid by the discovery of the first touching of the mineral vein, and Mr. C. at length had the satisfaction of seeing some fine crystallized Arseniate of Lead in its native place, adhering to the roof of the mine. Observing this we went eagerly to work, and procured some capital specimens, though our great object was to obtain those rare minerals, Brochantite, Cupreous Sulphate of Lead, and Caledonite.

Wending our way a further distance of a hundred and sixty fathoms, another difficulty presented itself, that was not quite so readily surmountable; the sides of the mine had given way, and entirely stopped the water from running in its natural course. We therefore began to clear away portions of the wood, stone, and soil which arrested our progress. Mr. C., though he had never handled a pick, working away with the greatest good humor, and with such good effect that we hoped our united exertions would in another minute have enabled us to proceed; but in this we were doomed to disappointment.

The clearing away of the rubbish only gave vent to a large quantity of water that had accumulated behind it, and the obstacle being removed, our rush led the water with the greatest force, carrying everything before it. The suddenness of the outburst was such that I had the greatest difficulty to retain my footing, but having somewhat recovered my surprise, I remembered Mr. C.; looking round I observed that gentleman standing in water at least two feet deep, and in a perfect bewilderment of amaze, as his situation was not only exceedingly unpleasant, but entirely unsuspected. Though my own position was anything but agreeable, I could not forbear laughing at the ridiculous figure both of us presented; but Mr. C. only replied by his reproachful looks. I then went on personally to the depth of four feet, but finding the water increasing in depth, and that it was impracticable to proceed further in our investigation, I returned, and found Mr. C. standing in the same spot, and in the same attitude of astonishment. We then made the best of our way out, and retraced our steps, the evening having far advanced before we reached the village and our landlord.

The inconveniences to which Mr. C. had been subjected had not, however, damped his ardour. We, therefore, after partaking of a bountiful breakfast, started again, at an early hour, to renew our search. Taking a different route, we proceeded by Wood Hall, and, passing the park, took a westerly direction towards the mountains. We soon arrived at an extensively worked mine, called Sandbed; but here we found nothing of importance, except some good Sulphuret of Zinc, this being the only locality for that mineral in Caldbeck Fells. Our plan was now to visit Drigga, an ancient mine which had been worked for four centuries, as there we expected to reap a goodly harvest. My companion found that climbing the very sides of the mountains was a most fatiguing operation, and several times did we stop on our way, as much to admire the beautiful view around us, as for the purpose of rest and refreshment. From the height we had obtained the view was most extensive, comprising mountains, hills, valleys, moors, and plains, and even from one spot we gazed down upon the very pretty little village in which I was born.

At last we arrived at Drigga, but here again were disappointed, for every bit of stone had been ground down to extract the ore from it. On we went, until we reached a small but interesting mine, called Drygill, which lay between two stupendously high mountains. In our course hither we had to pass over the edges of some dangerous rocks, and, of course, as guide, I led the way, when my progress was arrested by bearing a lusty shout for help. I quickly turned round (though this was attended with danger), and beheld poor Mr. C., who had lost his footing on our narrow path, sliding down towards the edge of a fearful precipice. A moment later and he would have been beyond the reach of human aid, but fortunately my extended hand was in time to save him from his peril. Thence advancing along a narrow path we came to the place where the miners were at work. Their dress consists of a flannel shirt and trousers, and wooden clogs well elamped with iron; on their heads they wear a red or blue worsted nightcap, presenting a rather uncouth appearance. Notwithstanding their appearance and roughness of manners, the liberal demeanor with which Mr. C. presented them had the desired effect, and they displayed great kindness in showing the most interesting parts of the mine, and the operations connected with it. We then examined a portion of the vein which breaks out to the light of day, and discovered some excellent specimens of the Arsenic phosphate of Lead, in very fine and perfect crystals. This mine, and those in its vicinity, are, without doubt, the most productive in the mineral district of Cumberland, no less than thirty different substances being found in that locality.

Descending then to the village with our spoils, which were not very weighty, we passed the night in rest, and early next morning Mr. C. departed for the metropolis, highly delighted with his two days' tour.

State Geological Survey.

The Placerville Republican speaks of the State Geological Survey as follows: Mr. Ashburner, the able assistant of Prof. Whitney, in the State survey, arrived in town yesterday from the Washoe region. He speaks in enthusiastic terms of the exceeding richness and vast extent of the mines on that side of the mountains. Mr. Ashburner says that the whole Washoe country is one of the most peculiar and extraordinary regions, in its geological aspects that he has ever seen. He speaks of the Ophir mine in particular, as exceedingly rich, and likely to continue so for an indefinite period. The California on the same vein, only one hundred and fifty feet south of the Ophir, offers a fine show of rock scarcely inferior to the Ophir, so far as it has yet been developed. In a few days Mr. Ashburner goes to Grizzly Flat, to examine the quartz mines in that vicinity. Prof. W. himself is at present with the main party attached to the survey engaged near Corral Hollow, to make an examination of that district, with reference to its geological aspects generally. After finishing his investigations in that vicinity Prof. Whitney will return to visit the gold region. He expects to be prepared to make a report to the Legislature early in the session, embracing the result of his examinations in reference to the famous Tin Mines of Temescal, the Coast Range, the Quicksilver mines of New Almaden and New Idria, and the Coal Mines of Mount Diablo. The report will also embrace preliminary notices of the copper mines of Calaveras, and the principal quartz mines of the States.

Great Surgical Invention.

The above illustration is one destined to benefit mankind, and relieve patients of unnecessary pain. Fred. Kesmodel of this city, has just obtained a patent for this invention and of which we shall now proceed to give an explanation. The instrument in shape is exactly like a syringe. E represents a strip of India-rubber, stretched between two oval shaped plates, and at its outer edges strips of sponge, the whole affixed with screws. F F is the neck and is made to fit C, having a corresponding tube or neck. B shows the body of the syringe, and the whole is about one half the size of one for use. A is a handle to a piston.

This simple but great instrument is intended to take exact impressions of invalids affected with hernia. The Plaster of Paris is mixed to its proper consistency in B, and is forced out into E; the India-rubber, which is being held against the ruptured part when the plaster is thus forced out by A, will remain perfectly hard and solid, since all the water and moisture has been absorbed by the sponge, and India-rubber will have yielded to cavities where the rupture existed. Surgeons know too well that nine-tenths of the bandages are impracticable, and hurt the patients.

For further particulars we refer the readers to Mr. F. Kesmodel, who resides on Kearny street, near Washington, San Francisco.

Geyser Spa Springs.—The water of the celebrated Geyser Springs has been analysed, by Dr. Lauzwert, of this city, and found to contain the following properties:

Bicarbonate of Soda.	4.87 grs.
" " " " " "	2.45 "
" " " " " "	95 "
Carbonate of Iron.	1.24 "
Carbonate of Lime.	2.39 "
Chloride of Sodium.	86 "
Sulphate of Soda.	46 "
Silica.	08 "
Loss.	
Carbonic acid gas free.	

The spring is owned by Messrs Casey and Kelly of Sacramento City, and intend introducing the water into general use. Messrs. Graham & Co. are the agents for this city. It can be furnished to saloons and private families as cheap as ordinary soda water.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, SEPTEMBER 21, 1861.

NO 1.

Still Going.

The Trinity Journal speaks thus of the exodus to the Nez Perce mines, from the vicinity of Trinity county:

For a few weeks there was a cessation of the exodus from this county in the direction of the new mines up in Washington Territory, and we hoped, and so said, that the excitement had died away. But within the last few days the fever has broken out afresh, and we frankly confess we believe the excitement about the Nez Perce mines is greater now in this county than two months ago. Men are leaving every day, and others are preparing to leave as soon as possible. There is no cause for the excitement, that we know of, except the favorable reports received by private letters. These all say there is gold there: some who have already reached the diggings, write back and advise their friends to come immediately, and others advise them to remain where they are.

There are now in the mining district some 7,000 men, only about one-third of whom are at work, the rest are merely prospectors and lookers on. The amount of gold brought down as yet is but a trifle, when we take into consideration the number engaged in digging it out. Another thing is painfully apparent; the white men in the Nez Perce county are on the eve of a sanguinary war with the Indians, who are very numerous in that part of the Territory.

Taking into consideration the probable difficulty with the Indians, the hard winter now coming on, and the not over flattering reports from the diggings, we cannot consistently advise any one to go there before another season opens. On the contrary, we would admonish our friends to let well enough alone for the present, and stay where are.

NEWSPAPER ADDRESSING MACHINE.—The following is a description of a newspaper addressing machine, invented by R. & D. Davis, of Elmira, N. Y., and recently introduced practically in several of the large newspaper offices of New York. The machinery consists essentially of two distinct parts, one lettering the type or blocks with which the impressions are made, and the other doing the printing. The lettering machine consists of a disk or wheel, about eight inches in diameter, on the periphery of which are firmly attached dies, representing the letters of the alphabet. By revolving this wheel or disk on its axis, a die representing any desired letter is brought into position, and stamps its impression on a small block, when another letter is put in position, and so on until the entire address is stamped, which is accomplished in about the same time required by a compositor to set the same number of types in a stick. A large number of these blocks having been impressed with the addresses, are readily attached to a band, thus forming an endless belt of blocks. These belts are systematically arranged in boxes, so that any address may be referred to in a moment for change or other purpose. When used, a belt is taken from the box and placed on a printing machine ready for operation in a few seconds, when the impressions are made by a slight pressure with the foot, as rapidly as the papers or wrappers can be removed from the press. The entire apparatus is operated by hand, is simple, compact, cheap, requires no skill to work it, and is not liable to get out of repair, which render it well adapted to papers of small as well as large circulation.

SUGAR A REMEDY FOR DRUNKENNESS.—Dr. Lecœur, of Caen, says that he has found in white sugar as efficacious a remedy for drunkenness as ammonia. No rationale has yet been adduced for the action of so simple a substance as sugar, except that it serves to bring on a different fermentation than the existing one in the stomach, and to neutralize, by the formation of new compounds, the action of the liquors.

On the Geology of the White Mountains.

At a recent meeting of the Philadelphia Academy, Mr. J. P. Lesley communicated the result of some recent observations on the Geology of the White Mountains of New England. His examinations of these mountains had led to the conviction that the range would prove to be synclinal instead of anticlinal, and therefore probably of Devonian age. A section which he made in 1857 along the Grand Trunk Railroad showed him the synclinal structure, with comparatively few dips, and at least two main anticlinal divisions. The profile in the Franconia notch is evidently a cliff outcrop of a horizontal plate. The newly opened Greely Mountain House in Waterville, in a cul-de-sac valley at the head of Mad River, and six or eight miles in an east line through the woods from the Plume House, is surrounded by bold outcrops of nearly horizontal massive plates of granite. Ascending Mad River from Campton, the traveler has the White-lace range on his right, with apparent gentle dips to the northwest. But on his left he has the Welsh mountain range and Mount Osceola, with an unmistakable and universal dip, never over fifteen degrees, to the southeast, which can be studied for at least seven miles northeast and southeast. Turning to the left and ascending Mount Osceola (which Mr. Lesley found by barometer to be over 2600 above the Greely House, and therefore not much lower than Mount Lafayette), the bridge path mounts over successive outcrop edges of perfectly horizontal plates of granite, as evidently and regularly bedded as any of the sand stone masses of the Alleghanies, the bed planes not being at all disguised by the cleavage planes. Between these plates of granite lie plates of unchanged dark blue sandstone, a rock which at the cascades (two miles from the house in another direction) has been mistaken for greenstone trap. The successive terraces and cliffs of the mountain are evidently the consequences of this horizontal and alternate structure. As in other horizontal mountain plateaus, the terraces here are projected between the ravines in the form of noses, with straight crests, and terraced or stepped at their ends. In fact, to a practical topographical eye, the aspect of the whole White Mountain range is that of synclinal erosion.

Other considerations reinforce this opinion. The continuation and broadening of the range northeastward through Maine and Lower Canada, where super-silurian rocks abound,—the termination of the range southeastward before reaching Massachusetts and Vermont, as the Alleghany synclinal stops at Catskill before crossing the Hudson,—the presence of horizontal rocks at Worcester, and more generally than would be supposed, through middle New England,—the fact that the Connecticut valley runs everywhere under the western escarpment of the White mountains, separating it from the silurian range of the Green Mountains, and the presence of Potsdam and other low formations in eastern Massachusetts,—all these facts would find their explanation in a synclinal terminal eroded structure of the White Mountain mass.

The granite of Mount Osceola and the surrounding heights consists of large crystal of feldspar, smaller crystals of quartz and smaller flakes of mica. Here and there hornblende appears. The rock bears no resemblance to the sub-silurian Highland and Blue Ridge range and Adirondacks. It is friable under the weather, shedding its crystals upon the ground under every overhanging ledge. The boulders are rounded by the weather action apparently more than by movement: for they have only traveled down the slopes beneath the cliffs from which they have fallen, and where those that remain are sharp-angled. The peculiar gravel and sand of the Mad River valley is a local drift of similar origin. The metamorphism of these granites is considered by Logan, Hunt, and others, as no longer disputable. They could easily originate in the clayey sandstones of Formations VIII., IX. and X. of the Appalachians.

Considering the whole White Mountain mass a synclinal plateau, then the summit of Mount Washington, which is such an acknowledged anomaly, becomes regularly the single residual fragment of the highest formation which escaped erosion. Its rock is so different in texture and structure from the rest of the mountains that no other explanation seems possible; and if this hypothesis be adopted, there is no longer any need of that which supposes the submergence of New England up to the base of the head of Mount Washington and no higher, leaving the head in the air to escape the general rounding and polishing action. It becomes easy to consider the external difference due rather to the difference of the rock formations above and below that horizon.

FILTER FOR CORROSIVE LIQUIDS.—Boettger, of Frankfurt, employs for the filtration of corrosive liquids a glass funnel, the neck of which is loosely plugged with gun cotton. This substance properly prepared has the proper fibrous, porous texture for an efficient filter, and being a product of the action of the most corrosive agent, viz, mixed sulphuric and nitric acids, is scarcely attacked, even in the slightest degree, at medium temperatures, by any single agent or solvent, so far as known, except acetic ether. It may be employed for filtering strong nitric, fuming oil of vitriol, permanganate of potash, strong caustic potash lye, and aqua-regia. Even chromic acid may be separated from its mother liquors by this filter. Its use in drying crystals which have been deposited from corrosive liquids is obvious. The gun cotton employed by Boettger is probably that obtained by the action on cotton of the strongest sulphuric and nitric acids, as that prepared by weaker acids, or by sulphuric acid and saltpetre, is soluble in a variety of agents.

USEFUL APPLICATION OF AMMONIACAL CHLORIDE OF ZINC.—By dissolving equal equivalents of chloride of zinc and sal ammoniac, a double salt, composed of these two substances, readily crystallizes in six-sided prisms. This salt possesses the power of dissolving oxide of copper and oxide of iron. It is therefore possible, by means of a concentrated solution of the ammoniacal chloride of zinc, to polish rusty spots on iron and copper. In tinning copper vessels, the solution of ammoniacal chloride of zinc is of great advantage; the surface to be tinned is to be treated with it, and the vessel placed over a charcoal fire; then when the surface appears perfectly bright, the tin is poured in, so that it may spread over the surface. This method is also applicable for coating with lead.

A NEW BLACK DYE.—A new dye has been recently discovered in Algeria, which is the subject of considerable interest among French chemists and manufacturers at the present time. The discovery has been made by M. Muratore, and is a vegetable substance gathered from a tree which grows in immense profusion all over the colony. It is destined according to the report made upon its merits, to replace every other substance in use for the same purpose up to this day, and is more brilliant than any dye hitherto known. The discoverer has registered his patent for its use, under the name of Algerian Campeachy Wood.

THIN CAST IRON.—At a recent meeting of the Manchester Philosophical Society, Mr. Fairbairn, the President, exhibited two large pans of cast iron, procured from China, where they are used for boiling rice. The metal, which is at the strongest part only one-tenth of an inch in thickness possessed considerable malleability. The President remarked that the art of making such large castings of thin metal was unknown in England.

NEW ROAD TO WASHOE.—A surveying party is laying out a new road to Washoe through Anador County.

Composition of Minerals.

"Almighty Cause! 'tis thy preserving care,
That keeps thy works forever fresh and fair;
Hence life acknowledges its Glorious Cause,
And matter owns its Great Disposer's laws;
Hence flow the forms and properties of things;
Hence rises harmony, and order springs.
Thy watchful providence o'er all intends:
Thy works obey their Great Creator's ends,
Thee, Infinite! what finite can explore?
Imagination sinks beneath thy power;
Yet present to all sense that power remains;
Revealed in Nature, Nature's Author reigns."

Boysse.

Comparatively few of the minerals that afford so great a degree of pleasure to the collector in their acquisition and arrangement occur in a simple form, but when analyzed, are found to be composed of two or more ingredients, often of opposite natures; and upon their nature and the proportions in which they are combined depend the characters of the substance which they compose. On this department of our subject it is neither within our limits nor our province to dwell at any length, more especially as we are strengthened by the consideration that, should we happily succeed in awakening in the intelligent mind the desire to pursue the study to its furthest bounds, the many excellent works already published will enable the student to proceed satisfactorily in his inquiries. Our intention is rather to point out the beauties appertaining to the science, and simply to indicate the methods of pursuing it, than to enter into elaborate details of the chemical processes by which the composition of a mineral is determined, and the exact proportions of its ingredients ascertained. But in order that the beginner may understand the grounds upon which the arrangement of mineral substances is based, it will be necessary to notice the several sections into which minerals are divided, according to their chemical composition. As the order of arrangement proposed by Mr. Phillips is at once the most simple and the most natural, we shall notice, first, the Earths; secondly, the Alkalies; thirdly, the Acids; fourthly, the Metals; and lastly the Combustibles.

The following is a list of the Earths that are found to enter into the composition of minerals, viz:

Alumina.	Magnesia.	Thorina.
Barytes.	Silex.	Yttria.
Glucine.	Strontian.	Zircon.
Lime.		

It must be observed, that, though for our purposes it will be sufficient to treat of all these earths as simple bodies they are all (with the exception of Silex, which is considered to be an acid) chemically proved to be metallic oxides.

Four of the earths enumerated, viz. Barytes, Lime, Magnesia, and Strontian, are termed Alkaline Earths, from their possessing some of the properties of the alkalies; the remainder are distinguished, when in a pure state, by their insolubility in water, and by their being fixed or incombustible in the fire.

Alumina is never found pure, but enters largely into the composition of many of the earthy minerals, amongst which we may mention all the varieties of Agate, and of Garnet, and the different kinds of clay. It is a principal ingredient of most of the precious stones, and, next to Silex, is the most abundant of all the earths.

Barytes is only found in combination with either carbonic or sulphuric acid, but is not by any means of common occurrence. It is the heaviest of all the earths and is a deadly poison.

GLUCINE.—The only substances in which this most rare earth occurs are those valuable gems, the Eucase, Beryl, and Emerald, and the scarce mineral, Gadolinite.

LIME.—This earth has never been found pure, but is an ingredient of many of the earthy minerals, and occurs in the greatest abundance in combination with carbonic acid, of which all the interesting forms and varieties of Calcespar may be cited as examples; but a still more familiar instance of the occurrence of Carbonate of Lime is one that is endeared to every lover of the picturesque and beautiful, namely, the snow-white chalk cliffs of Old England. The utility of lime renders it the most important of all the earths to mankind, and consequently the most interesting to the mineralogist.

MAGNESIA most usually occurs in the form of a carbonate, but combines also with several other acids, and is a principal ingredient of Serpentine, both precious and common. Its medicinal use is well known.

SILEX.—This is the commonest of the earths, and is said to enter into the composition of full two thirds of all the earthy minerals known. It occurs almost pure in the numerous varieties of quartz, rock-crystal, opal flint, and the sands of the sea-shore.

STRONTIAN is not an earth of frequent occurrence. It may be distinguished from Barytes, which it much resembles, by its giving a purple color to flame, instead of yellow. It is never found pure.

THORINA, YTTRIA, and ZIRCON have only been found in one or two rare minerals, and have not been put to any use.

To be continued in our next.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207 766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For parting silver from gold when gold

is below 300-1000ths. fine. 3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " .14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS.

\$1.16-4-11ths. cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1.21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1.16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1.16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

PURE NATIVE SONOMA WINES.

RED, WHITE, AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them into the market, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma. M. G. VALLEJO.

At the depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo, for specimens of his Wines exhibited at the various Expositions held in different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by

A. S. LOWNDES & CO., Agents,
617 Montgomery street, opposite Montgomery Block, San Francisco.

COAL OIL! COAL OIL!! COAL OIL!!!

WARRANTED PURE

WITH NO MIXTURE OF CAMPHENE, OR OTHER EXPLOSIVE MATERIAL

SPERM OIL!

The Best and Cheapest Oil for Farmers' Use

RAPE SEED OIL!

In Tubs and Cases—at very low rates.

MACHINERY OIL!

Of Superior Quality—at reduced prices.

PRINTING OFFICE REMOVAL.

THE COMMERCIAL BOOK AND JOB STEAM
PRINTING ESTABLISHMENT

Has been removed to the New Office,
No. 517 Clay and 514 Commercial Streets.

Book Printing, Law Briefs, Catalogues, Business Cards, Hand-Bills, Circulars, Theatre Work, American Flags, Envelopes, Badges, Bills of Fare, Programmes, Posters, Legal Blanks.

We keep constantly on hand and for sale, an assortment of

NATIONAL FLAGS AND BADGES,

In beautiful and extensive variety. Sole manufacturer of the

NEW UNION ENVELOPE,

With original and Patriotic verses. Everybody should use it.

Our Office is complete and perfect in every respect,
And we shall endeavor, in the future, to merit a continuation of that patronage which we have heretofore so generously received.

VALENTINE & CO., PROPRIETORS.

Please call and give us a trial.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be chased with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to deprecate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleaning grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plate or runner of each set is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the Smut Balls, Oats, Chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals, whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. SILVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:
1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.
2nd. Being Self-feeding and Self-charging, they require but little attention, one man being sufficient to attend thirty or more.
3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars inquire of the Patentee,

J. B. BEERS
105 Clay street,

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. HUNT'S

IMPROVED FIRST PREMIUM
WIND MILLS!

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 208 & 201 Jessie street,
SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built.

The following committee awards the above premium: Devoe, Garratt & Ware; all of this city.
PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125 ap19 E. O. HUNT, Builder.

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000

IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties desirous to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that purpose, by resolution of the Board.

The books of Subscription are open at the office of FINE & BAYARQUE where the required first instalment of 10 per cent. will be received.

A SPLENDID OPPORTUNITY.

AGRICULTURAL MACHINERY.

As I have taken, for five years, a large portion of the State Prison Labor, for the sole purpose of manufacturing AGRICULTURAL IMPLEMENTS AND CABINET WARE

I offer for sale, at a Great Sacrifice, in order to close out my present stock by September First, 1861, the following articles:

TWELVE-HORSE STEAM THRESHERS;
C. M. RUSSELL'S EIGHT AND TEN-HORSE THRESHING MACHINES.
J. A. PITTS' GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND TWELVE-HORSE POWER, with all of C. M. Russell's Latest Improvements.

HAY PRESSES, REAPERS AND MOWERS;
EXTRA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE RAKES.

All of the above goods will be sold at the Lowest Prices, either for Cash, or good approved paper at a low rate of interest.

THOS. OGG SHAW,
33 Sacramento Street.

AGENCY FOR PATENTS.—The undersigned having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Patents and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS. DAN LYNCH,
720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and salesroom for

Phelan's Patent Combination Cushions and Modern Billiard Tables, Billiard T. bles,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables

BERGER'S BIJOU BILLIARD TABLES,

With PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition a

Phelan's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine it. The Great Master, Mons. Berger, speaks of the Tables in the highest terms of commendation. To private families these Tables commend themselves, especially on account of their convenient size and as an article of furniture for a private dwelling there is nothing more desirable; in short, no household or mansion with any pretensions to be well regulated, should be without one. Gentlemen about to build residence should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful, and health-giving game of Billiards.

And Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc. Exhibition and Salesroom, No. 720 and 722 Montgomery street. M. E. HUGHES, Billiard Table Manufacturer, 723. Manufactory, Market street, opposite Orphan Asylum. jy13

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SA TURDAY.....SEPT. 21 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sanson streets, by

J. SILVERSMITH, Editor and Proprietor.

At Fifty Cents per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOGRAPHY and ELECTROGRAPHY, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

IV VOLUME OF THE PRESS.

With this number we enter upon our fourth volume of this journal. We congratulate our many patrons upon this happy advent; that we may continue to add many volumes of a like existence, so far as prosperity and success are concerned, and adding as much instructive matter to the PRESS as we advance. We are now beyond a doubt as to the continuance in the publication of the PRESS. "The mountains have spoken to the seas," said Caxten; and so have the miners spoken to us, not by words, but their mite of four dollars per annum for the MINING AND SCIENTIFIC PRESS.

We have had quite a struggle in establishing our diminutive sheet, but we are gratified to say that by dint of perseverance, strict business application and a straight course, we have placed the PRESS among the first publications of the Pacific Coast—advocating and bringing before the world our extensive mineral resources, and inventions and discoveries of whatever nature. We owe the journals of this State many obligations for kindness extended to us. We must, however, urge them once more not to lose sight of mining news, of which many seem not to pay attention thereto.

Our patrons will no doubt be pleased to learn that since our association with Mr. R. W. Fenwick Esq., of Washington, D. C., in the Patent Agency business for this coast, we have added the illustrious and talented Judge, D. C. Law-

rence, for nearly twenty years in the Patent Office, where he officiated as Commissioner, Examiner, Chief Clerk and member of the Board of Appeal.

FROM OUR TRAVELING CORRESPONDENT.

OMEGA, Sept. 12th.

EDITOR MINING AND SCIENTIFIC PRESS.—SIR.—In my last Omega was in ashes. To-day she is nearly "herself again." Buildings are going up rapidly; the saw and hammer make a constant din; and four stores—one a fire-proof brick—are well under way; a large hotel is being built—the usual number of "rum mills," etc. Teams are constantly arriving laden with freight, and the people are fast making "all snug" for "winter quarters."

This place is twenty miles northeast from Nevada, and from the last of December till the 1st of May is inaccessible to teams, owing to the deep snows. At present there are two lines of stages running in from Nevada, over a good mountain road. The mining resources are extensive, being the largest gravel deposit on this range. Water is abundant ten months in the year. One ditch has been brought in from the South Yuba, a distance of twenty-three miles, at a great expense, by the South Yuba Canal Company—Messrs. Kidd, Whartenby and others—one tunnel through a ridge—distance 3400 feet, costing \$125,000. This ditch also supplies Alpha Phelps Hill, Gold Hill and Nevada. Its total cost was \$750,000.

The Omega Company's ditch, formerly known as the Virginia Ditch, also from the South Yuba, furnishes a large supply of water, which the miners are noways loth to use during the winter, spring and summer months.

Water from these ditches is now shut off for repairs. Claims here pay well; there has been no big strikes for a short time, but steady and ample remuneration for work done. The miners yield to none in facilities for effectual working. Martin & Co., are a fair sample, being fitted up with all the modern improvements, and working through a long and very expensive tunnel. They are using one of Matteson's Water Power Derricks, of which they speak in high terms. Messrs. Creamer & Sceptles have good claims, and wash large quantities of dirt every year. Perkins & Co. have been working on Stirling Hill since '54, and have two bed-rock tunnels to their claims. They are also using Matteson's Water-wheel, the first put up in this State: they would not dispense with it on any account. Shanellum & Co. have a tunnel 450 feet to their claims. After washing two years it was found to be too high, and they joined with three other companies in a large tunnel, which is now in 1200 feet, with a branch three hundred feet to Green, Lind, Templer & Co.'s claims. Shanellum & Co. have yet a branch to run four hundred and fifty feet. Their ground has been thoroughly tested, and is known to be good.

Other tunnels and claims are worked extensively, and will be for years to come; and Omega with her large range of gravel hills will be a flourishing mountain town when others of less resources will have gone down.

The Union sentiment is the order of the day; next is Temperance—the place having two orders—the Sons of Temperance and the I. O. of Good Templers. In proportion to the inhabitants, the Sons of Temperance are fairly entitled to be styled the banner division of this State.

I shall leave this place for Alpha, via Spiritsville, a place sprung up lately from diggings having been discovered at the head of Scotchman's Creek, and deriving its name from the number of spiritualists that has settled there and held their nightly circle.

Yours &c.,

RADIN.

Working of Mines.

SHAFTS.—It is of great importance, with reference to the ultimate issue of an undertaking, to choose correct sites for these works; since they not only constitute the highways to and from the horizontal galleries, but also afford the necessary facilities both for unwatering the mine and removing its produce.

Where extensive permanent operations exist, vertical shafts are desirable, especially when large lifts of pumps are to be placed within them; but in the case of commencing preliminary trials in unproved ground, it becomes a question worthy of careful consideration, whether a saving of money as well as of time will not be effected by the use of underlie sinkings. Objections founded on the nature of the rock being unfavorable to the mode of working are entitled to considerable weight, but those advanced against the expense and inconvenience involved by it may readily be met by the

adoption of suitable mechanical appliances. Apart from ventilation and pumping, shafts are only used for winding or climbing. For the latter purpose, inclined are preferable to vertical shafts, and we need therefore only consider their adaptation to winding. Hitherto the drawing of stuff in inclined shafts has been attended with much expense, since no systematic means have been employed for the removal of friction and prevention of strain. These evils are readily obviated by introducing a kind of guide railway from the mouth of the shaft to the bottom. This may be constructed either of wood or iron, and laid in accordance with the inclination of the lode. The kibble should not only be provided with wheels to run on the rail, but should also have anti-friction or guide wheels, so disposed as to retain it in its course in ascending or descending. The form of the kibble should be such as to admit of its being readily filled or discharged. If these appliances be adopted in connection with underlie shafts we conceive that the drawing cost will be less than by vertical ones without guides; whilst the relative difference of cost of sinking in accordance with the two systems is very great, apart from the excess of time necessarily occupied in sinking vertical shafts.

ADIT LEVELS.—A large amount of time and money is sometimes squandered in resorting to drainage by means of an adit level. Whatever facilities the neighborhood may offer for this system of drainage, it is never prudent to resort to it if its cost will much exceed that required for the erection and maintenance of machinery, to secure the same object. In this respect long shallow adits, a few fathoms only below the surface, are seldom advisable, since to explore ground to any useful depth machinery must be erected, and when this is done, the cost of raising water an additional ten or fifteen fathoms is but trifling.

An adit level generally affords drainage to a very limited depth only, and possesses few advantages other than saving the cost of drawing water from its level of intersection with the lode to the surface line. When once this depth and the quantity of water are known, the cost for the necessary machinery and the expense of pumping can be approximately determined. If these be compared with the expense incidental to the driving of a level the relative advantages of the two systems in both money and time become apparent.

WINDING ENGINES.—Considerable economy has been effected in the haulage of stuff by the substitution of steam for horse power. The machinery employed in Cornwall for this purpose is usually more expensive in first cost than that in collieries; whilst the speed of the rope is not only slower but the weight lifted at a draught is on the whole much less.

The monthly engine reports of Mr. Browne, show that for the year 1856, twelve engines raised 35,833 kibbles from a mean depth of one hundred and thirty nine fathoms, or 15.8 kibbles, weighing together 17,450 pounds, by the consumption of one hundredweight of coals, and that the average duty of the machines amounted to 15.6 millions of pounds, raised one foot high by the combustion of the foregoing quantity of fuel.

Most of the Cornish winding engines have been designed with a view of economizing fuel; but it may be doubted whether the engineer on the whole thus succeeds in effecting a pecuniary saving; since it must be recollected that an economy of fuel extending over a considerable period, will be required to set off the difference of first cost and the resulting interest on outlay.

A machine of this kind should be characterized by cheapness of construction, durability, simplicity of action, and facility for the regulation of speeds. Horizontal eages are often preferable to vertical ones, and many colliery managers prefer winding directly from the fly-wheel shaft, instead of placing the rope on a drum set in motion by toothed-gearing. When the former is done, a steam drag is occasionally connected with the fly-wheel, which the engine-driver brings into operation as may be required.

The difference of expense between steam and horse whims has been estimated by Mr. Carne to exceed fifty per cent. in favor of the former. But this is certainly less than the true result.

It has been, as before stated, found highly advantageous to run the kibble in guides fixed vertically in the shaft. This apparatus was formerly constructed entirely of wood, but, of late years, wire ropes have been successfully employed. The cost of rope guides is comparatively light, and is soon recovered in the decreased expense required to maintain the shaft in repair, whilst the system of guiding the progress of the kibble allows of more rapid and steady haulage.

THE HIMALAYA MOUNTAINS.—The brothers Schlegel, who have recently returned to Europe from an exploration of Thibet and Nepal, Asia, state that they succeeded in reaching the summit of Ibiganuri, one of the Himalaya mountains, 22,260 feet high, which is the greatest height ever attained on any mountain. The peak lately called Mt. Everest, of the Himalaya chain, is the highest mountain in the world at present known, being considerably over 29,000 feet above the level of the sea. The natives have two names for it—one of them, Gorishanka, which is mythological, is to be found only in the Nepalese, and the second name, Chingomnara, is that by which it is known among the people of Thibet.

SUMMARY OF MINING NEWS.

CALIFORNIA.

TRINITY COUNTY.—Good prospects have been obtained on the Main South Fork, at Spruce Flat, three miles below the Ketinshaw trail. Jim Wilburn & Co., who have been prospecting there for some time past, having struck dirt from a hundred buckets of which they washed out \$4.25. A number of Chinamen had gone over into that region.—*Douglas Gazette.*

The claim of Messrs. McCauslin & Co., at the lower end of Steiner's Flat, is now yielding a rich return for the labor which has been bestowed on it. Nearly three thousand dollars was taken out last week, and it has been paying well all the time since it was first opened.

PLACER COUNTY.—A company of Chinamen have purchased the entire ground from just below that classical locality, "Shurt Tail Bend," up to the mouth of Dutch Mary's Ravine and intend to work the entire distance. Americans have long since abandoned the ground.

AUSTRALIA.

Since the departure of the Great Britain and the Suffolk there has been nothing doing in the shipment of gold. Prices are unchanged. The banks are buyers at £3 13s. 6d. per ounce for standard gold, which, with the export duty of 2s. 6d., brings the cost on board ship, exclusive of charges, to three pounds sixteen shillings per ounce. The following are the brokers' quotations for alluvial gold:

For Omeo, 68s to 71s 6d.; Pleasant Creek and Goulburn, 74s to 75s; Sandhurst and Castlemaine, 75s to 76s; Maryborough, Danollp, Avoca, Amherst, Back Creek, Piery Creek and Ararat, 76s 6d to 77s 6d.; Ballarat, 77s 6d to 78s 6d. per ounce. The weekly exports have again been much under the average, the total amounting to only 25,234 ounces, against 32,660 ounces, for the corresponding week of last year. The average weekly total for the first quarter of the year was 36,713.

The shipments were heavy last week, the Great Britain having taken the largest quantity shipped in one bottom during the current year. The following parcels have been dispatched:

	Oz.
By the mail steamship Benares, for Galle	42,825
Great Britain, for Liverpool	82,419
Suffolk for London	4,037
Jupiter for Hong Kong	6,098
Previous shipments corrected by comparison with the entries passed at the Customs.	711,649

Total 847,827
Or thirty five tons six hundred two quarters two pounds three ounces troy, of the value, £4 per ounce, £3,391,308. Up to the corresponding date of last year, the shipments amounted to 822,842oz., or 34 tons 5ewt. 3qr. 3lb. 6oz., of the value, at the same rate, of £3,291,768. It will be seen by these tables that, while the export returns show an apparent falling off in the yield of 72,118oz., as compared with those of last year, the shipments exhibit a real increase of 24,885oz.

THE MILKY SEA.—At a recent meeting of the French Academy of Sciences, the Minister of Marine sent in an extract of a report from Captain Trebacht, of the Caprieuse corvette, dated Ambogna, August 18, 1860, and in which he states that on the night of the 20th of that month, while tacking to reach Ambogna, lying at about twenty miles E.N.E., he and his crew witnessed the curious spectacle of the milky sea, which the Dutch call the Winter sea, because both the sky and the waters present the appearance of fields covered with snow. The phenomenon lasted for seven p. m. until the return of daylight. They at first attributed it to the reflection of the moon, then only three days old; but as the appearance continued after the moon had set this explanation had to be discarded. A bucketful of sea water being drawn up and examined, it was found to contain about two hundred groups of animalcules of the same thickness (that of a hair) but of different lengths, varying between one and two tenths of a millimetre, and adhering to each other by tens and twenties, like strings of beads. These insects emitted a fixed light, similar to that of the firefly or glowworm, and it was admitted on all hands that the white appearance of the sea could only be attributed to these minute creatures, the numbers of which must therefore exceed all imagination.

SPLendid FIND OF GOLD.—We had an opportunity yesterday of inspecting a fine parcel of 216oz. of gold from Kingover, that field so rich in large finds of the precious metal. The exact locality is a secret, but we believe it was obtained in the immediate neighborhood of the Union Reef Company's ground. It was found in a large mass of quartz and required a great deal of labor to clean.

IMPURE AMALGAM.—One of our mills having lately turned out an unusually impure cake of amalgam, it was only by accident discovered that its impurity was occasioned by the use of zinc and tin buckets in baling—the quartz having been taken from a wet shaft. The弊 may be useful to miners working below the water level, and may save some of the custom mills from blame which they would not deserve.

NEW STAMP BOX IN QUARTZ CRUSHING.—The new stamp box introduced by Mr. Evans, mining manager at the works of the Eaglehawk Association, Tarragower, is now being used, and, from a first inspection, it will apparently be a success. The tailings that come from it are certainly finer than from the gratings and, from the quartz being stamped into the main body of quicksilver, the process of amalgamation must of necessity, be more effectual than by ripples. Mr. Evans believes he will be able entirely to do without ripples. Should he succeed the saving in expense will be very great, as the frequent breakage of the gratings, consequent stoppage of the works, and the tedious and expensive operation of clearing up the ripples will be avoided. This week a good trial of the scheme will be afforded, and in the meanwhile the inventor intends protecting himself by registering, with a view to taking out a patent. Mr. Paller's amalgamator was tried lately, and it was discovered that no quicksilver escaped from it. It is intended to pass a ton of tailings through it, when its capabilities for saving gold will be shown.

A Nugget.—A man named Hoffman, a puddler, working near Maryborough, found, lately, in his puddling mill, a nugget weighing thirty-five ounces.

A parcel of two tons two hundredweight of quartz, from Blucher's Reef was crushed this week at Brown's machine, McCallum's Creek, and turned out the extraordinary quantity of one hundred and two ounces, or eight and three-quarter pounds of gold. What makes this yield the more remarkable is that the claim from which it was taken had been registered, and left unworked for some time.—*Maryborough Advertiser.*

OREGON.

A correspondent writes as follows to the Oregon Democrat:

As several gentlemen have returned from the east side of the Cascades and Des Chutes river without giving full satisfaction to the excited mining community of Oregon, I will try to satisfy the people, after six weeks hard prospecting in that country. Three of us in company left Clackamas county on the first of July, and with us we had a map of the country where McNary, Meek & Co., picked up the gold in 1845. We traveled across the new trail, via Sweet Home Valley; after we got across the mountains we took a southeast direction for fifty miles, crossed the Des Chutes on a raft, took a south course, traveled over sandy deserts where the sand fourteen inches deep and hot enough to roast an egg, without water sometimes for thirty-six hours kept a south course for two hundred and seventy-nine miles, found the Lost River without quite bursting, unpacked our animals, eat some salt bacon and slap-jacks, and set forward on the gold hunt. The first thing that we found was the running gears of an old wagon, the next was gold in abundance, rare enough; here was gold in great quantities: we passed a little further up the stream, to an old camp, where the train had camped in '45 and found a large horn with McNary's name on it; the horn was full of gold, sealed up at the large end, so we had to take the gold out the little end of the horn. While here at this place the boys shot a gopher of enormous size, which we cleaned and found a lump of gold in its throat weighing eleven pounds. This no doubt was the same gopher that scratched up the lump of gold in '45 that one of the train picked up. We found several small horns all full of gold. We measured twenty-one bushels and three pecks of gold in three days and put it in a hollow log, and went up the river to hunt for more gold; we had not gone far when we saw a perpendicular rock of gold where the train had passed, as we supposed, some very warm evening as the sun was setting, for it left a perfect miniature of the train of seventy-five wagons on the rock of gold. A large gopher stood erect, with a large lump of gold in its mouth. Some of the train had written on the rock: "I will swear, as sure as I am from Pike, that this end of the rock is gold, the other end I do not know whether it is or not."

We put in a blast and knocked off 397 tons of pure gold, and started for this valley; we are now buying mules and horses to pack in our gold. We want 9,769 Cayuse horses; 4,999 mules; 3,789 men, for which the best wages and highest market price will be given.

After holding a meeting we have come to the conclusion that we will make the following donations: Three thousand dollars to each and every emigrant that was in the Meek and McNary train; five thousand dollars apiece extra to Meek and McNary; ten thousand dollars extra to the Doctor who hammered out the piece of gold on the wagon tire; twenty-five thousand extra to the man that got the lamp that the gopher dug up; one million to build a railroad to California, and six millions for a railroad from Oregon to the Atlantic States; the balance to be divided between the people of Oregon.

From the same journal we learn that prospecting is being prosecuted by miners in every direction—east, west, north and south from this place. Not a day passes that there is not from ten to twenty men leave this place on prospecting tour. Some return discouraged, but none in the report that gold is to be found in almost every part of the mountains, but not in quantities to pay at the present high rate of provisions. Others return with good news of new discoveries, and laying in a supply of grub, depart immediately for the newly discovered diggings, causing a stampede in the direction in which they go.

When I arrived here two months ago, the South Fork mines were deemed a humbug, but the energy and perseverance of the miners have demonstrated that the mines on that river are as good, if not better than the mines in this vicinity. From conversations I have had with, and letters which I saw from reliable persons who have prospected pretty thoroughly on the South Fork and its tributaries, I am led to believe that there is enough gold there to afford employment for thousands of men for years to come. Besides the diggings already known to the miners up here, there are believed to exist a continuous chain of gold fields from Frazer River several hundred miles south, and which will give employment to from fifty to one hundred thousand men for several years. I am informed that about two-thirds of those coming to the mines go on to the South Fork. The miners there are making from five dollars to twenty dollars a day to the hand; on some streams they make as high as ten dollars a day with a rocker. I give the figures as reported to me.

Phil. Henderson and John Parker of Linn county, who have been mining on Rhodes' creek, during the past spring and summer, left this town on Monday last for their homes near Albany, having disposed of their claims. I am happy to be able to chronicle the fact that they took with them quite a respectable pile, the result of their industry while they have been mining here. Linn county is well represented in the rich claims on Rhodes' creek, and I expect to have the pleasure of recording this fall, the departure of several more Linnites with gold.

The "Farmer" says Mr. A. J. Dufar, of the Columbia Bottom "Quartz Mines," recently exhibited in our sanctum a beautiful specimen of quartz product, weighing several pounds. Mr. D. informs us that although the season has been unfavorable, his diggings have "panned out" tolerably well,—and that he will continue to make a No. 1 article of cheese for the Portland market. Thank you, friend Dufar,—we want no better cheese than you make.

A well armed party of one hundred and thirty-seven men, with two hundred and seventy-five animals, left Portland on the second instant, for the new gold mines on the Malheur river east of the Cascades, which are reported richer (because more lately discovered) than those of the Nez Perces.

The Oregon Farmer contains a number of schedules of prices, from which we copy one in reference to Natural History, Mining products, arts, etc. If our State or County institutions carry out a similar policy, they would enhance their interest manifold, especially the mining community, artisans and mechanics:

MEXICO.

The "S. J. Press," gathered the following items from a friend: Gold and silver bearing ledges of great richness rib this country in every direction. Lead also abounds. There are placer diggings of course gold, that would be of great value but for the scarcity of water. Immediately after rains, the women go out in many places and pan out an ounce a day. Yet with all these fine advantages, the incorrigible indolence of the people, and their utter indifference as to the future, causes them to remain in abject poverty. While they have a pound of food in the house they scorn work, and are blissfully indifferent as to where their next meal will come from after that pound is gone. Corn tortillas, beef and sugar are their exclusive articles of diet, save in the fruit season before mentioned. Mining is the principal occupation of the lower orders, their mode of working, however, being most primitive. Their excavations are performed exclusively with a crowbar, and the ore is packed out of the mines, however deep, in sacks on the backs of laborers.

Mr. Kraft thinks the country presents much more encouraging inducements for the introduction of American or European enterprise, than the Washoe region. He returns immediately to enter largely into mining operations.

When can a gold digger measure his success? When he discovers it in quartz.

NEZ PERCES DISTRICT.

A correspondent of the Sacramento Union writes as follows:

That the pay in the new mines ranges all the way from "wages"—that is five dollars per day—to twenty and twenty-five dollars, and still higher. The gold is like that found on Feather river in this State, and is eight hundred and seven thousandths fine, worth about sixteen dollars twenty-eight cents per ounce, though some is not so fine. The writer then adds:

One thing is certain, a man cannot pan out anywhere without finding from the color to good prospects. The difficulty at present is that it is too late to open out claims with any probability of their being worked this season. Hence many have returned to Oregon and California with intent to come back at the earliest moment practicable next season.—That this is a gold region is certain. That gold has been found within the limits of a very extensive scope of country is also certain. The vast stretch embraced within the bounds of the Rocky and Wind River chains on the east—the great basin on the south drained by the Snake and its tributaries, from the headwaters in the Rocky Mountains to its junction with the Columbia—the sweep of country on the north drained by the Clark's Fork, from its headwaters in the Rocky Chain to its confluence with and thenceforward the valley drained by the Columbia itself—together with the whole scope watered from the Cascade Range on the west, are found to teem more or less with the precious metal. Not only is this the case, but it is thus far found to be equally distributed. The gold land is not so spotted as it is in California. The mineral is imbedded in a light gravel: at least it is so in the river beds and in the gulches. Quartz to all its varieties of intermixture with mica, felspar, talc, etc., as well as clay-slate, abound on every band. Doubtless rich gold-bearing quartz ledges are yet to be revealed to the searching gaze of earnest prospectors. The quantity and quality of the mineral land, however, already discovered, render it indisputable that these mines are not only remunerative to those now here, but extensive enough to insure this to be a populous and permanent mining region.

The working season in the rivers is from the middle of June to the end of November. Gulches may be worked as early as March or April, the Indians say; but it is certain the winters are long, intense and snowy. It is thought there will not be much trouble with the Indians. The Snakes and Nez Percés lately held a three days' council, and the latter, who are the most powerful and noble, decided nearly unanimously in favor of peace, one of their chieftains left with his lodges in high doodgeon and is gone over to the Snakes. Since then the Snakes have committed some murders, and the friendly Nez Percés say they will send some four hundred warriors to help the whites if needed.

ARIZONA.

The Los Angeles Star of Sept. 7th, learns, by arrival from Tubac of Mr. Poston, of the Sonora Mining Company and Mr. Pampuli, of the Santa Rita Company, also a large party who arrived previously, that the state of the country is most deplorable. The Mexicans and Indians having full sway all over it. Arizona is in fact deserted. First the Indians make an incursion, kill the whites, and carry off what plunder they can; then the Mexicans come along and pick up everything they can find lying loose.

In this way the mining interest have suffered almost irreparable injury. The mines of the above named companies were in a fine condition for working: a very large amount had been expended on them, and now as the companies were beginning to realize something for their labor, they are driven out. The Mexicans carry off the ore, and entering the mines, tear down the pillars left for support: thus almost destroying the mines which are soon filled up with water.

Among the names of those killed, we have heard that of Leut. Mowry, at the Patagonia mine. Those who have made good their escape and arrived here think that the Ours have suffered the same fate.

The party suffered greatly from their departure from Santa Rita, to their arrival on the border of this State, being destitute of all food but a small allowance of corn.

All the stations of the Overland Company are deserted, and no assistance could be procured on the way. Arizona is represented as wholly deserted.

WASHOE MINES.—In the single district of Washoe, including Virginia City, Gold Hill, Silver City and the region dependent on Carson river, there are now in operation somewhere near one hundred quartz mills, extracting gold and silver, and nearly every one of them paying good dividends, while several of them yield as high as \$30,000 per week dividends. The aggregate weekly yield of these 100 mills, is \$860,000 or \$43,720,000 per annum.—*Stockton Independent.*

THE AURIFEROUS LEDGES OF WASHOE.—The California Farmer is informed by a person largely engaged in quartz crushing in Washoe that there are now connected with Gold Hill sixty-one quartz mills: these will crush sixteen tons each a day, or nine hundred and seventy-six tons: this will average forty-eight dollars a run, equal to \$6,848 a day.

PACIFIC MAIL STEAMSHIP COMPANY'S line to PANAMA connecting via the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company, at Aspinwall.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$15.
Durgen, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caney Ledge, \$25.
King Charles, at Flowry, \$6.
Edgar Co., Great Western Ledge, Geleena, \$20.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.

[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

PIONEER RIDING ACADEMY

LIVERY AND SALE TABLES,

Nos. 207 and 209 Montgomery street, one door from Jackson, San Francisco

ORRICK JOHNSON

PROPRIETOR.

Horses kept on Livery.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street.

MASSEY & YUNG.

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FIRST-CLASS PHILAN'S TABLES, will be opened for business on SATURDAY, June 29th, 1861. The undersigned, respectfully solicits the patronage of all Gentlemen Billiard Players, and hope by conducting their Saloon in an exceptional manner, to merit their continuance and support.

WHEELER & WILSON'S

FAMILY SEWING MACHINES:

NOT ONLY

THE BEST FOR FINE SEWING,

..BUT THE BEST FOR..

MANUFACTURING CLOTHING

..AND..

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cassimere and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them cannot be surpassed.

Various styles of Machines have been employed on the above materials but the Wheeler & Wilson is preferred.

DONALD MCLENNAN,

Proprietor of the Mission Woolen Mills

Distribution of Iodine.—Chatin, the well-known French chemist, insists that there is iodine in the atmosphere. He has found it in the rain water of Florence, Pisa and Lucca, as well as at Paris. Further, he adds that he has found it in five samples of distilled water, and three specimens of potassium from the best laboratories, and he believes that it may be found in all potassiums and most rain-waters. M. Chatin cannot succeed in isolating the iodine, but he feels none the less certain of its presence.

The Miner's Gold and Silver Saver! By Letters Patent.

We have just sent on drawings, specifications, and applications for Letters Patent, to Washington, for the above apparatus. Among modern inventions and discoveries, we venture to say no other can compare for its complete and thorough application, and its general principles. The models of which we have duplicates are now to be seen at the office of this journal, and are open to the examination of those acquainted with metallurgical operations. In our opinion we must admit that it is the only one based upon strictly philosophical principles; overcoming all short comings of all the known amalgamating processes and methods. We are satisfied it must work to within five per cent., although it is claimed by the inventor that it will work the ore—iron pyrites or sulphurets, both Gold and silver to its standard value of precious metals. The machinery or apparatuses are simple and easily constructed, and not so expensive as most others. The inventor is now on his way to Esmeralda, where he is practically employing this invaluable process. Information, or purchase, or right of use may be effected with the Editor of this journal.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supersede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that, 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in a better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silver-smith, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Cam Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

Yours, truly,
G. W. HAMMERT, A. BALDWIN,
M. CROWDER, CHARLES MCARDON,
D. R. MEACHAM.

June 12th, 1860.

MR. STANDISH—Sir: Your Mower was tried in my clover meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harnet's field, and I am pleased with its performance. The cam wheel power over that of the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging-bearings and boxing, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,

ELAM BROWN.

PACHECO, June 23, 1860.

MR. STANDISH—Sir: This is to certify that I have operated one of your mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not get in the knife in clover, or cut any grass.

G. F. BROWN.

Witness: Washington A. Wilson, W. T. Hendrick.

LAFAYETTE, June 27th, 1860.

MR. STANDISH—Sir: I saw your mower at work in down clover and oil. Very heavy growth; it performed better than any mower I have ever seen for simplicity, durability and lightness of draft, it certainly has not its equal.

Respectfully, yours

WARREN B. AEN.

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This Mill will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

SPRING VALLEY WATER WORKS CO.

S. E. corner Montgomery and Jackson sts., San Francisco.
WATER! WATER!! WATER!!!

Water will be let into the pipes of the Spring Valley Water Works, this afternoon, (July 19) in addition to that heretofore let on, in the following streets: In Brannan, from the corner of Harris to Third street. In Third street, from Brannan to Townsend. In Third street, from Brannan to Folsom; including South Park. Also, from corner of Third and Harrison to Harrison and Fourth streets. All parties desirous to have the water introduced into their premises please make application for the same, at the Office of the Company.

July 20

A. W. VON SCHMIDT, Chief Engineer.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing. KNAPP, BURDELL & CO.,
ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munm & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM DON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

Measurements of the Alleghany System.

It is well known to the scientific men of this country that Professor Arnold Guyot, of Princeton, New Jersey, has devoted a portion of his summer vacations for ten years past to the study of the different portions of the great Alleghany system which faces the Atlantic Coast from Canada to Georgia. Several years ago he measured the highest peaks of the Adirondack, Green and the White Mountains, in the north of the chain, and more recently he has been at work on the southern portion of the system, which is found to possess the most elevated peaks of the whole Appalachian chain.

By a private letter from Professor Guyot, we learn that during his last summer (1860) he has devoted two full months to further measurements in the southern company with Messrs Saadon and Grand Pierre. The weather has been propitious, and he has accomplished much work, having measured one hundred and fifty and two hundred points in addition to those which were previously determined. He has extended his investigations as far as Georgia, and has seen the extremity of the Blue Ridge and the Unaka.

These measurements sufficiently indicate the grand traits of structure of that loftiest portion of the Appalachians system. It may be seen that the Rnan and Grandfather mountains are the two great pillars on both sides of the North-gate to the high mountain region of North Carolina, which extend between the two chains of the Blue Ridge on the east and the Iron and Smoky and Unaka mountains on the west. That gate is almost closed by the Big Yellow mountain. The group of the Black Mountain rises nearly isolated on one side in the interval between the two chains, touching by a corner the high pinnacle of the Blue Ridge, and overlooking all the neighboring chains by a thousand feet. In the large and comparatively deep basin of the French Broad Valley, the Blue Ridge is considerably depressed, while the western chain preserves its increasing height. Beyond the French Broad rises the most massive cluster of highlands and of mountain chains. Here the chain of the Great Smoky mountains, which extends from the deep cut of the French Broad at Paint Rock, to that, not less remarkable, of the little Tennessee, is the master chain of that region, and of the whole Alleghany system. Though its highest summits are a few feet below the highest peaks of the Black Mountain, it presents on that extent of sixty five miles a continuous series of high peaks, and an average elevation not to be found in any other district, and which give to it a greater importance in the geographical structure of that vast system of mountains. The gaps or depressions never fall below five thousand feet, except towards the southwest and beyond Foreney Ridge, and the number of peaks, the altitude of which exceeds six thousand feet, is indeed very large. On the opposite side, to the southeast, the Blue Ridge also rises again to a considerable height, in the stately mountains of the Great Hogback and Whiteside, which nearly reach five thousand feet, and keeps on in a series of peaks scarcely less elevated far beyond the boundary of Georgia.

Moreover, the interior, between the Smoky mountains and the Blue Ridge, is filled with chains which offer peaks higher still than the latter. The compact and intricate cluster of high mountains, which form the almost unknown wilderness covering the southern portion of Haywood and Jackson Counties is remarkable by its massiveness and the number of lofty peaks which are crowded within a comparatively narrow space. The Cold Mountain chain, which constitutes one of its main axis, shows a long series of broad tops, nearly all of which exceed six thousand feet. Near the south end, but west of it, not far from the head-waters of the French Broad, the Pigron, and the Tuckasegee waters, Mount Hardy rises its dark and broad head to the height of 6133 feet. Still further northwest the group culminates in the Richland Balsam, 6425 ft., which parts the water of the two main branches of Pigeon River and of the Caney fork of the Tuckasegee. Amos Platt's Balsam, in the midst of the great Balsam chain, which runs in a parallel direction between the two main chains, measures 6278 feet. Considering, therefore these great features of physical structure, and the considerable elevation of the valleys which form the base of these high chains, we may say that this vast cluster of highlands between the French Broad and the Tuckasegee rivers is the culminating region of the great Appalachian system.

New Map of the Alleghany System.—The measurement of Professor Guyot, just referred to, furnish important data for the correction as well as the completion of all existing maps to the regions which he has examined. These data, with the exception of those collected in the past summer, have been employed by Mr. Sandoz, a nephew of Professor Guyot, and an accomplished draftsman, in the construction of a new map of the entire Alleghany chain, which has been published in the July number of Petermann's Mittheilungen. Mr. Sandoz has accompanied Mr. Guyot on many of his mountain expeditions, and took the results with him to Gotha where the chart was drawn and engraved under the direction of Dr. Petermann.

The scale of the map is 1:6,000,000. Two detailed subordinate maps are printed on the same sheet with it, having a scale of 1:600,000, one of which gives the White Mountains of New Hampshire; the other the Black Mountains of North Carolina, both according to Mr. Guyot's measurements.—*Silliman's Journal*.

VOLCANOES AND SULPHUR SPRINGS.—The Los Angeles Star of the 24th ult., says:

Mr. Joel H. Brooks arrived yesterday from Coso and vicinity. He gave us a specimen of pure brimstone, which he picked up on the desert, having discovered an active volcano pouring forth a stream of sulphur.—This is rather a curiosity in the way of volcanoes. There is no distinct crater, though almost an infinite number of pipes, probably 10,000. Hot steam and sulphur is discharged, the latter of which congealing, forms the pure brimstone of commerce. Alum is also found pure, and in great abundance. It appears as the sulphur congeals, it throws out a coating of alum, the brimstone forms around the flues. These sulphur springs cover about two acres of ground. They are situated on the side of a volcanic hill, about 300 feet above the level of the plain—20 miles south of Coso, and fifteen miles northeast of Little Owen's Lake. These springs have been claimed by the discoverers. Messrs. Brooks and Hart, for the purposes of trade. By fastening a yeast-powder box to a willow pole they dipped up the boiling sulphur.—The steam issuing from the pipes is so hot as to blister the hand in coming in contact with it. The ground is generally so soft and so hot that planks have to be used in crossing it. Surely the hot place we read about, is not far from that volcano.

PHOTOGRAPHY.—We have in this country, one photographic journal. England alone has six, all ably edited. London boasts of six photographic societies; and it is stated that every considerable town in England has such a society. The British Government save \$50,000 per annum in the reduction of ordinary maps by photography instead of by hand. Photographers have taken the sun when in eclipse: they have caught an impression of a shell whizzing through the air, discharged from the mouth of a thirty-six inch mortar; they have caught the wave as it broke on the shore, the sea depicting even the drops falling from its toppling crest; more, they have not failed in getting a "good impression" of the head of a criminal, executed by the guillotine, catching the severed head in mid air as it fell into the basket below. Photographic book marks and visiting cards are sold by the thousand, while photographic shirt studs and waistcoat buttons, ornamented with microscopic miniatures, are being daily produced in countless number at the button manufactory in Prussia; portraits of popular persons, Garibaldi for instance, being ordered at a time. On authority of a careful English writer, all his photographing requires the use of no less than twenty oz. silver per annum.

VOLCANO ON THE SOUTHERN DESERT.—The Los Angeles Star is informed by a person from the vicinity of Coso, that he discovered an active volcano on the desert, which was pouring forth a stream of hot sulphur. There is no distinct crater, though almost an infinite number of pipes, probably 10,000. Hot steam and sulphur are discharged, the latter of which congealing, forms the pure brimstone of commerce. Alum is also found pure, and in great abundance.—It appears that as the sulphur congeals it throws out a coating of alum, the brimstone forming around the flues. These sulphur springs cover about two acres of ground. They are situated on the side of a volcanic hill, about three hundred feet above the level of the plain—twenty miles south of Coso, and fifteen miles north east of Little Owen's Lake. By fastening a yeast powder box to a willow pole, they dipped up the boiling sulphur. The steam issuing from the pipes is so hot as to immediately blister the hand by coming in contact with it. The ground is generally so soft and hot that planks have to be used in crossing it.

We extract the following from the *Trinity Journal*. There is every indication of prosperity in and about Weaver-ville. We do not know of a single untenant dwelling in the village; in fact, the demand for houses is greater than the supply. New buildings are going up in every direction; village lots advancing in value, and better than all, much attention is being turned to improving and beautifying homes. Large thrifty looking orchards begin to show themselves, and shrubbery, in as great variety as in the cities below, adorns the dwellings. One great improvement has been completed this summer. We refer to the water works of J. S. McCain & Co. The pipes are extended down Main street to the theater, and along the ridge from the Court House to the residence of J. E. Church, Esq. By this means our citizens have a constant supply of pure water for house and irrigating purposes, and many of the yards and gardens on Taylor and Center streets give evidence that the water is plentifully used. The road leading to town is better than it has been for five years, although a few days work in grading, throwing out the large rocks, and filling in gullies might be put into advantage.

NEW DIGGINGS.—We see it stated that some rich specimens of silver ore have lately been discovered on the north fork of the Mokelumne river. It is said to much resemble the Washoe ore.

CALIFORNIA LLOYD'S—MARINE INSURANCES.—Office, Southwest corner of Washington and Battery streets. The undersigned are prepared to issue Marine Insurance Policies, each being responsible for the sum written against his own name only, and for himself and not for the others, or any of them.

JAMES PHELPS, JAMES B. HAGGIN, LAFAYETTE MAYNARD,
J. MORA NOSS.

Geyser Spa Springs.—The water of the celebrated Geyser Sp. Springs has been analysed, by Dr. Lanzweert, of this city, and found to contain the following properties:

Bi Carbonate of Soda.	4 87 grains
" " magnesias.	2 45 "
Carbonate of iron.	95 "
Carbonate of lime.	1 24 "
Chloride of sodium.	2 39 "
Sulphate of soda.	85 "
Silica.	45 "
Loss.	08 "
Carbonic acid gas free.	

The spring is owned by Messrs Casey and Kelly of Sacramento City, who intend introducing the water into general use. Messrs. Graham & Cunningham are the agents for this city. It can be furnished to saloons and private families as cheap as ordinary soda water.

SAN FRANCISCO, SATURDAY, SEPTEMBER 28, 1861.

NO. 2.

A New Alkaloid in Coca.

Coca is the name under which the leaves of several species of Erythroxylon are and have been known in Peru from time immemorial, and which, especially among the Indians, are used for chewing, mixed with a little unslaked lime or wood-ashes. A moderate use is said to produce such an excitement of the functions as to enable the chewer to remain some time without food, and to bear the greatest bodily exertions; while an immoderate chewing of coca, like that of opium, frequently becomes an habitual vice, producing the deleterious symptoms and consequences of narcotics, such as a state of half intoxication, of half drowsiness, with visionary dreams, premature decay, complete apathy, and idiocy. These peculiar symptoms rendered the presence of a narcotic principle very probable, and have induced Professor Wächler to undertake the investigation of the substance.

The examination has so far succeeded by the usual method for the separation of alkaloids, in eliminating a crystallizable base, cocaine, crystallizing in small prisms, devoid of color or odor, slightly soluble in water, more readily in alcohol, and very easily in ether.

It possesses a strongly marked alkaline reaction, and a bitter taste, and acts in so far peculiarly as it transiently benumbs or almost paralyzes the part of the tongue which it touches. It bears some resemblance to atropine in its chemical relations, and forms perfect salts with the acids.

Antidote for Phosphorous.

Poisoning by phosphorus is becoming common from the facility of procuring friction matches. It is, therefore, important that the antidote which has of late been found the most efficacious should be extensively known.

Messrs Antonielli and Barsorelli have shown by numerous experiments on animals:

1st. That fatty matters should not be employed in poisoning by phosphorus, as these matters, far from preventing its action on the viscera, on the contrary increase its energy, and facilitate its diffusion through the economy.

2d. That calcined magnesia, suspended in boiled water, and administered largely, is the best antidote, and, at the same time, the most appropriate purgative to facilitate the elimination of the toxic agent.

3d. That the acetate of potash is extremely useful when there is dysuria in poisoning with phosphorus.

4th. That the mucilaginous drinks which are given to the patient should always be prepared with boiled water, so that those beverages may contain as little air as possible.

IMPROVING RIVER NAVIGATION.—The Red Bluff Independent mentions that the steamer Sam Souls, Capt. Pierce is engaged in removing snags and otherwise improving the Sacramento river between Red Bluff and Tehama. At the Tehama Bar a wing dam has been constructed which, throwing the water into one channel, will materially expedite transit at that heretofore troublesome point. This cleaning out of the river channel is no new thing. Every year the California Steam Navigation Company expend from \$25,000 to \$50,000 in the same manner. Still the company is denounced as a prodigious monopoly, and opposition boats are patronized because they carry passengers at low rates. But they have never invested a dollar in improving the river, and but for the enterprise of the old company would not be enabled to run their boats. Looking at this thing fairly we think the old company deserve more coppers and fewer kicks than they get.

IMMIGRATION.—The total number of immigrants arrived at New York to Aug. 14, was 51,862. The number to same date in 1860, was 65,978.

The Opinion of a Mineralogist.

Captain Cheever, having in his possession a quantity of the supposed coal, found near Chinatown, presented a portion thereof a few days since to Mr J. Kustel, metallurgist of the Ophir Company, for his inspection. The latter, whose opinion is worth, perhaps, as much as that of any other man in the Territory, at once pronounced it the outcrop of coal: intimating that deposits of the genuine article, might be looked for with confidence in the neighborhood where this was found. Mr. Kustel is not only master of everything pertaining to the science of minerals, but practically acquainted with the signs of coal, in all its varied positions and stages of formation; therefore his judgement is quite conclusive in matters of this kind.

It appears from experiments made in this place, as well as elsewhere, that the substance taken from the small stratum, burns readily, leaving no doubt about its being a good article of coal. But of this there is comparatively little, the stratum being no more than two and a half inches thick.

The great mass of carbonaceous matter, however, consisting of several heavy strata, is less combustible, and will not be of much service for the purposes of fuel, unless more thoroughly carbonized at a greater depth, as experience leads to the belief that it will be when opened. Indeed, we believe that really good coal is not often met with upon the surface, nor is it generally looked for until the water line is reached, or at least, such a depth as will insure the high degree of heat, incident to great pressure. In this view of the subject the indications already found, furnish grounds for believing a coal deposit of some magnitude exists at that locality, and that a country so prolific of mineral wealth, has not been left without the means for rendering it available for purposes of utility and commerce.—*Age.*

Effect of Carbonic Acid on the Skin.

According to a paper recently presented to the French Academy, on the above subject, one of the most singular properties of carbonic acid is its decided effects upon the skin. All parts of the body that come in contact with it feel immediately an extraordinary increase of heat which is not exhibited by the thermometer.

A person placed in a room heated to twenty degrees Centigrade, and plunging his naked arm into a receiver full of carbonic acid gas, feels as though he had put his arm in to something fifteen or twenty degrees hotter than the air of the chamber.

This property has been turned to account medically in thermal establishments where baths and doules of the gas, sometimes pure and sometimes mixed, have been administered to invalids, with what effect is not stated.

M. Boussingault says that in a trench of an old sulphur mine in New Granada, he was almost suffocated and brown into a violent perspiration by this gas, the heat of which he believed, at the time to be equal to forty degrees; but his thermometer, after being left an hour in the trench, only marked nineteen degrees—three degrees in fact less than the temperature of the surface in the shade. The professor also felt a pricking sensation in the eyes from the effect of the gas, and he was assured by the miners that they almost all suffered from weakness and blindness.

NEW HORSE DISEASE.—The overland immigrants are said to be losing many horses this season, by a malady called the Mountain Thirst. The disease is a species of swelling, which originates in the vicinity of the throat, sometimes extending over and under the entire jaws, down the throat and into the breast of the animal, thus closing the respiratory organs and producing death. Some think the cause of the disease is the sting of a fly: others a species of poisonous grass. No remedy is known for it.

REMARKABLE MASS OF METEORIC IRON.—Among the collections made by Dr. John Evans, United States Geologist for Washington Territory, is a small mass of iron, which has been examined by Dr. Charles T. Jackson, of Boston, and found to be meteoric. According to Dr. Evans, the specimen was taken from a large mass which projects three or four feet from the soil of Rogne River Mountain, in Oregon. The part exposed is four or five feet in width and length. The following is the result of an analysis by Dr. Jackson:—Specific gravity of the pure metallic mass, 7.8334; 10.7 grains yielded,—

Iron.....	89,000
Nickel.....	10,290
Tin.....	0,729

100.019

Nitric acid produces on a polished surface the usual Widmanstian figures. It resembles the Siberian Pallas meteorite, and like it contains large crystals of chrysolite, the cavities left by them being as large as filberts. This remarkable meteorite is only forty miles from Port Orford, and could be got for shipment without great expense. Dr. Jackson has urged its removal to the Smithsonian Institution at Washington.

A SPLENDID SPECIMEN.—A poor man named Curtin, who has quite a large family to support, while walking over a pile of battings on Gold Hill, one day last week found a beautiful piece of solid gold—worth nearly three hundred dollars—which had been thrown out of their sluices by some mining company years ago, and which had probably been walked over by hundreds of people unnoticed. We wish Mr. Curtin may find several more of the same sort—few who find "Chispa's" put them to such good use as he does.

STRENGTH OF ICE.—Recent experiments in Germany show that when the thickness of ice is an inch and half, it will just bear the weight of a single man; when about three inches and a half it will bear detachments of infantry, with their ranks rather wide apart; with a thickness of four and four-tenths inches, eight pounders can be conveyed over it on sledges; five and two-tenths inches will bear twelve pounders, eight inches will bear twenty-four pounders; and a thickness of twelve inches will bear almost any weight.

NATIVE IRON IN AFRICA.—At a recent meeting of the Boston Society of Natural History, Dr. Hayes stated that he had received additional information from Liberia, Africa, which rendered it improbable that there are any deposits of native iron in that country, as has been hitherto supposed; the singular specimens of African iron forwarded to this country, which have given rise to the supposition, owing to their apparently natural structure, to a peculiar method of smelting the ore adopted by the natives.

A GORILLA ATTITUDE.—The gorilla at the British Museum is in a standing position, the head inclined forward as if about to spring; the mouth wide open, displays two formidable rows of teeth; the right arm extended above the head, grasps the branch of a tree next which it is standing, while the left, drawn across the chest, appears ready to deliver one of those terrific blows which M. Du Chailu so vividly describes.

California and Australia yield nearly \$1000,000,000 of gold annually, the latter leading the former about \$10,000,000.

Extensive and remunerative gold fields have been discovered in the province of Otago, New Zealand.

Composition of Minerals.

[Continued.]

The Alkalies are four in number; they are chiefly distinguished by their solubility in water, and by their chemical power of neutralizing acids. They are potash, soda, lithia, and ammonia. These are never found in a pure state, nor do they enter into the composition of the metalliferous ores; but the three first are found in some of the earthy minerals, and the last combines only with two of the acids. They are proved by Sir Humphry Davy to consist of oxygen united to a base which is strongly suspected to be metallic. Potash, soda and lithia are particularly valuable in a commercial point of view, for combined with oils they are used in the manufacture of a most beautiful domestic article, known as Soap.

The acids that are found to enter into the composition of minerals are thirteen, viz.

Arsenic.	Mellitic.	Phosphoric.
Boracic.	Molybdic.	Succinic.
Carbonic.	Muriatic.	Sulphuric.
Chromic.	Nitric.	Tungstic.
Fluoric.		

These take their names from their respective bases: thus, the base of carbonic acid is carbon, that of molybdic acid is the metal molybdenum, that of the sulphuric is sulphur, and so on; these bases being combined with oxygen or hydrogen forming what are termed acids. The acids form, in conjunction with the earths, alkalies, or metals, those combinations, to which the terms arseniate, carbonate, sulphate &c., are, in mineralogical language, applied.

Only three of these acids have been found to occur in a native state—these are the sulphuric, the carbonic and the arsenic. Many of the acids, when obtained by chemical processes in an isolated condition, are largely used for various manufacturing purposes.

We have thus noticed the different earths, alkalies and acids which are found to enter into the composition of minerals, and have observed that on the various combinations of these elementary substances is based the most natural arrangement of the specimens in our cabinets. But these elementary substances are seldom found in an isolated state. More commonly we find two or more earths, an earth and an alkali, an earth and an acid, and so on, associated together. This will partly explain the divisions into which, taking Phillips for our guide, we have divided the descriptive portion of this article. For the rest we will quote Mr. Phillips's words:

"As rocks are constituted chiefly of earths, and metals are principally found in veins, earthy minerals may be assumed to be of earlier origin than the metalliferous, and hence minerals appear to possess a claim to a somewhat natural order of succession in our cabinets."

"Thus siliceous minerals are first described, because it is estimated that siliceous forms the largest proportion of the oldest and most abundant primitive rocks, and all earthy minerals of which siliceous is the largest ingredient are arranged under that head; beginning chemically with siliceous in its purest form, and proceeding to such as consist of that and other earths, as siliceous and aluminae, then to those consisting of siliceous and lime, &c., and afterwards to such minerals as are chiefly constituted of three or more earths, terminating with the most compound."

"Next after these minerals which consists only of one or more of the earths, succeed those in which one or other of the alkalies are found; to these such of the acids as occur in the concrete state; then those minerals which are primarily constituted of one or more earths and an acid; and finally, the very few in which an earth, an alkali, and an acid are combined together."

"The order of arrangement is therefore as follows:

- Earthy minerals.
- Alkaline earthy minerals.
- Acids.
- Acidiferous earthy minerals.
- Acidiferous alkaline minerals.
- Acidiferous alkaline earthy minerals."

To these succeed the metals and metalliferous ores, and after these the combustibles.

METALS.—We have already observed that all of the earths with one exception, that are found to be ingredients of mineral substances, are composed of oxygen united to a metallic base, and might therefore with same degree of propriety, be arranged under the head of metals; nevertheless, the earths not being simple bodies, we shall find it much more convenient to treat of such as are considered to be simple metals known to mineralogists as follows:

Antimony.	Chromium.	Iron.
Arsenic.	Cobalt.	Lead.
Bismuth.	Copper.	Magnesium.
Cadmium.	Gold.	Mercury.
Cerium.	Iridium.	Molybdena.
Nickel.	Silver.	Tungsten.
Osmium.	Tantalum.	Uranium.
Palladium.	Tellurium.	Vanadium.
Platina.	Tin.	Zinc.
Rhodium.	Titanium.	

Many of these occur pure or nearly pure in a natural state; when two of them occur in combination with each other, they are termed an alloy, but if combined with mercury are termed an amalgam. They are all possessed of

a peculiar lustre called metallic, and their weight compared with other substances, is very great. They are capable of uniting with acids, are insoluble in water, and are generally good conductors of heat and electricity. They are all fusible, but the degree in which they possess this quality varies greatly; Platina, for instance, requiring the strongest possible degree of heat to melt it, whilst mercury is not only fluid at the common temperature of our atmosphere, but continues so in a degree of cold much below that at which water itself becomes solid. Many of the metals possess the valuable property of malleability, and amongst these may be mentioned gold, silver, copper, and iron, which are malleable to a remarkable degree; others, such as antimony, bismuth, titanium, and manganese, are altogether destitute of that property, and are therefore termed brittle.

Although the question of the growth of metal is a most interesting one, no satisfactory conclusion has yet been arrived at on the subject. Some of the old theories are rather amusing, and are worth mentioning. Descartes asserted that metals were formed from the beginning of the world, and were ranged by the laws of gravity, about the center,—that they were afterwards corroded by the acids salts, and carried up with them by subterranean heat to various parts of the earth.

Tournefort, the botanist, supposed that minerals as well as plants originally came from eggs, and that the largest rocks were at first only as large as grains of sand! Yalden's poetical allusion to the subject of the primary causes of the formation of metals is very beautiful:

"Through dark retreats pursue the winding ore,
Search Nature's depths and view her boundless store.
The secret cause in tuncful numbers sing,
How metals first were formed, and whence they spring;
Whether the native sun, with chymic flames,
Through porous earth transmits his genial beams;
With heat impregnating the womb of night,
The offspring shines with its paternal light:—
Or whether, urged by subterranean flames,
The earth ferments and flows in liquid streams;
Purged from their dross, the nobler parts refine,
Receive new forms and with fresh beauties shine:—
Or whether by creation first they sprung,
When yet unspoiled the world's great fabric hung:
Metals the basis of the earth were made,
The bars on which its fixed foundation's laid:
All second causes they disdain to own,
And from the Almighty's fist sprung alone."

Whatever may be the true method and cause of the growth of metals, that they do grow under certain circumstances is not to be denied; and we may here quote the assertion of a practical observer (Mr. Wright of Liverpool) to whom we applied for information:

"Minerals do grow. I opened a vein that had not been worked for two hundred years, and from which the ore had been well cleared out; I found that the sides of the vein had been replenished with the carbonate of lead in crystals of an inch in length, which no practical man can doubt, have been formed since the period when the mine was worked."

We will conclude this brief notice by observing, in reference to metals and the metalliferous ores, that perhaps no division of the mineral kingdom is capable of exciting so great an interest in the mind of the mineralogist; not only because the detached specimens in his cabinet form its chief ornament, but because from the time of their being raised from the deep earth in a rough and crude condition, to the period when refined and fashioned by the skill of man, they assume the complicated form of some giant piece of machinery, the metals and their ores, during the progress of their transition, afford both physical and mental employment to many thousands of human beings. Metals, however, cannot be rendered available to the full extent in the advancement of our comforts unless much foresight and scientific knowledge are brought to the task.

"With sober aim, to serious end,
Be skill and industry combined:
Man's work must ever ead in failure,
Unless it bear the stamp of mind:
For this was man endowed with reason;
This raises him above the brute:—
The hand must plan with care and thought
Before the hand should execute."

Schiller's Song of the Bell.

COMBUSTIBLES.—The minerals placed in this division are different in character from metals, earths, alkalies, or acids, and are all of a highly inflammable nature. Of these carbon and sulphur form the principal ingredients. The Diamond is an example of carbon in its purest form; carbon also combined with hydrogen constitutes a gem still more valuable—the coal that is so necessary to our domestic happiness. It is the base of carbonic acid.

Sulphur is found not only in a pure state, but is of common occurrence in metallic ores, forming the sulphuret of the metal.

Several other minerals are also ranked amongst the combustibles.

The lively diamond drinks thy purest rays,
Collected, light, compact; that polished bright,
And all its native lustre let abroad,
Dares, as it sparkles on the fair one's breast,
With vain ambition emulate her eyes.—*Thomson:*

PRINTING OFFICE REMOVAL.

THE COMMERCIAL BOOK AND JOB STEAM
PRINTING ESTABLISHMENT

Has been removed to the New Office,
No. 517 Clay and 514 Commercial Streets.

Book Printing, Law Briefs, Catalogues, Business Cards, Hand-Bills, Circulars, Theatre Work, American Flags, Envelopes, Badges, Bills of Fare, Programmes, Posters, Legal Blanks.

We keep constantly on hand and for sale, an assortment of

NATIONAL FLAGS AND BADGES.

In beautiful and extensive variety. Sole manufacturer of the

NEW UNION ENVELOPE,

With original and Patriotic verses. Everybody should use it.

Our Office is complete and perfect in every respect,

And we shall endeavor, in the future, to merit a continuation of that patronage which we have heretofore so generously received.

VALENTINE & CO., PROPRIETORS.

Please call and give us a trial.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," wheat, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connection with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating out merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure, then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from smut, chaff, growa wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut Balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plater or runner of each sett is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zia or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the Smut Balls, Oats, Chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the single in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals, whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. SILVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

Office, Market street opposite Montgomery

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS. DAN LYNCH, 720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and saleroom for

Phelan's Patent Combination Cushions and Model Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for Phelan's Patent Combination Cushions and Model Billiard Tables

BERGER'S BIJOU BILLIARD TABLES,

With PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition a

Phelan's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine it. The Great Master, Mons. Berger, speaks of the Tables in the highest terms of commendation. To private families these Tables commend themselves, especially on account of their convenient size and as an article of furniture for a private dwelling there is nothing more well regulated, should be without one. Gentlemen about to build residence should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful and health-giving game of Billiards.

M. E. HUGHES, Billiard Table Manufacturer, and Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc.

Exhibition and Salesroom, No. 720 and 722 Montgomery street.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....SEPT. 28 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOGRAPHIC AND ENGRAVING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr. Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the

work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining; etc.; 7th. Processes for the Reduction of Gold and the Glossary of the technical phrases used in the work.—[Morning Call.

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its Character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

THE MINER'S COMPANION AND GUIDE.—In a recent notice of this invaluable work we omitted to give some of its leading features of interest and value specially designed for our mining community and metallurgists. This book has been carefully prepared and published by the enterprising editor of the "Mining and Scientific Press," of San Francisco. It contains nearly one hundred fine illustrations, with three hundred pages of interesting and instructive matter, forming a neat little volume substantially bound, at the low price of two dollars. It is thus far the best mining work issued on this coast, having complete treatise on veins and lodes, timbering of mines, manual of metallurgy, the geology of California, and the most important of all, many new and interesting methods for separating gold and silver ores, and pyrites, together with a glossary of technical terms not contained in any other work. The miners of this coast will find this an indispensable hand-book. Every Californian should possess it.—[Sac. Bee.

"THE MINER'S COMPANION AND GUIDE."—The visitors to this exhibition have no doubt seen the above titled and highly valuable work on Mining and Metallurgy, just issued by J. Silversmith of San Francisco, containing nearly 300 pages of matter pertaining to California mines, handsomely illustrated, printed and bound. This is, thus far, the only text book of its kind on the Pacific coast, containing full treatises for the working of mines, timbering, assaying, prospecting, reduction of ores, with the latest and most approved metallurgical processes; also, an extensive glossary of technical terms. Every Californian should possess it.—[State Fair Gazette.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins, and the manner in which the ore or rock is taken out. The second chapter of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California, contains seven pages, and that on the separation of metals from their ores, eleven pages, and the rest of the book is original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seven pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta Californian.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press," of San Francisco. The title of the work is the "Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

NEW BOOK RECEIVED.—The publisher has laid before us the following work, just issued by him: "The Miner's Companion and Guide," with illustrations. 24mo. pp. 232. San Francisco. J. Silversmith, 1861. This work gives information to the prospector, miner, geologist, mineralogist and assayer. It contains also a glossary of technical phrases used in the work. The volume appears to be clearly written, and no doubt contains much valuable and interesting information. The numerous wood cuts help materially to illustrate the text.—[Bulletin.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's rugged soil its hidden treasures.—[Union Temperance Journal.

Book Dealers and others will please send orders through mail or express to the office of this Journal.—Liberal percentage allowed.

The State Fair.

We are extremely sorry that we are compelled for want of space in this issue to give an extensive resumé of the last exhibition, which reflects great credit on its managers, to whom we are also indebted for courtesies extended while sojourning at the capital. In our next we shall give details.

ELECTRICAL CONVERSION OF SUGAR INTO ALCOHOL.—At a recent meeting of the French Academy, M. Niece St. Victor read a paper giving an account of some experiments which showed that, under certain circumstances, electricity produced the same effect on sugar as fermentation does, transforming it into alcohol. He found that by passing an electric current through very sugary white wine, the wine loses all its sugar and becomes much more alcoholic. On the other hand, the effect of the action of light on absolute alcohol, under certain conditions is to re-transform a portion of the alcohol back into sugar; the alcohol becoming very sugary, and having its strength reduced several degrees.

From our Special Correspondent.

HUMBOLDT CITY, Sept. 16th.

EDITOR MINING AND SCIENTIFIC PRESS.—Having heretofore acquainted you with the locality of these mines—their distances and hearings from various well known points, I have at this time to add, things are going on here prosperiously. First, we have had a large increase of population, the number of inhabitants being nearly doubled in the last two months, and now amounting to seven or eight hundred. Many of these are immigrants, just come over the plains, and though often poor, bring with them, generally, habits of industry and sobriety, that render them a very desirable addition to our population. Some of them also have families, and a little stock, both valuable acquisitions in a new settlement like this. On the whole, we have reason to congratulate ourselves both upon the increase and character of our people.

Building and other improvements go on as rapidly as could be expected considering the poverty of this community, and the great distance we have to haul all imported supplies. Goods have to be brought either from Red Bluff or Sacramento, the former 250, the latter 325, miles distant. All our lumber comes from Honey Lake, making a land journey of 135 miles. From that place also are drawn our supplies of fresh vegetables, butter, grain, &c. Hay comes from Lassen's Meadows, and other points on the Humboldt river, distant from ten to twenty miles. Trees, suitable for lumber, are said to exist in a range of mountains some thirty miles east of that in which these mines are situated. Here we have only a shrubby kind of cedar, and that not very abundant. When dry it burns well, and is of sufficient size for timbering the mines.

Most of the building is done with stone, of which there is an excellent article convenient to the town, the entire east wall of the ravine in which the latter is located, being a talcose slate, easily quarried and dressed.

About thirty houses, some of them large, and all neat and substantial, have been erected with this material, and at an expense of less than one half what lumber would cost. On the west side of the ravine, good lime rock is abundant. The best kind of clay with sand for making brick is also found near at hand. Thus, it will be seen, we are not without the means of building a large town at this point, should the necessity for one ever arise.

The quartz veins here, though not so numerous as in Esmeralda, and some districts in Washoe, are more separated and well defined. They run generally in a S. E. and N. W. direction, extending over a space thirty-five miles long and twelve wide—or, in other words, over the whole of this mountain range.

Generally the rock is soft and easily worked—in a few cases it is very compact, and can only be gotten out by blasting. In some of the ledges there is a great deal of gold, both free and combined; the prevailing metals, however, are silver and lead, the ore being an argentiferous galena. Metallurgists pronounce it a very easy ore to work. The cost of reduction will not be great, if the opinion expressed by some here, that the lead alone will defray that expense, be well founded. There are also present in the rock, in small quantities, iron, antimony and copper, but I believe no arsenic.

About twenty tons of rock taken from ten or twelve different leads have been shipped to San Francisco for reduction. Hundreds of assays and thousands of rude tests of the ores taken from these mines have been made, and generally with such results as have produced the greatest confidence in their richness. But it is only by reducing a large quantity of the average workable rock of a mine, that we obtain any clue to its actual value. The returns from the ore sent to your city are looked for with much interest. For myself I have not the least doubt about these being not only workable, but very valuable mines. In this opinion both capitalists and miners, as a general thing, seem to concur, the latter being unwilling to part with their interest without a good price, and numbers of monied men having already taken steps for getting in the necessary machinery for working the mines on a large scale.

In my next letter I will post you more fully as to the extent of these preparations, and supply you with a list of what are here regarded as the leading claims.

The weather here is very pleasant—neither too hot or too cold. We have plenty of water and of an excellent quality furnished by a fine stream running summer and winter through the center of the town. Nearly every camp through out the mines are equally well supplied with water. On the hills there is an abundance of hunch grass, with sufficiency of timber for fuel, and like purposes. There are few if any cases of sickness, nor do I hear of any serious accidents having occurred; while, as for crimes or flagrant misdemeanors, there have as yet been scarcely any committed in this community.—H. DEG. * * *

CALIFORNIA.

Andador county.—The Dispatch has at last reached us again after a lapse of several months. We glean the following interesting items therefrom. The mountaineers are literally alive with new prospecting for minerals of different kinds—gold, silver and copper. David Armstrong, Esq., who has just returned from a tour through the Esmeralda and Walker river regions, informs us that on the head waters of the Mokelumne river, and between the two summits several ledges of argentineous quartz have recently been discovered, and that numbers of miners are already at work getting out rich ore. He brings with him specimens that are unquestionably rich. Among these is a specimen of copper ore from a vein near Hope Valley, which he says is the richest he has ever seen. Though not rich it contained several per cent. of copper. That these high mountain regions are rich, in gold, silver and copper, proofs are accumulating daily. The rumor, announced by us last week of the discovery of a quartz lode between the two summits, turns out to have been true.

NEVADA TERRITORY.

We learn that five feet of rock salt in the Mammoth Lode, just below this city changed hands at the rate of seventy dollars per foot. From a reliable source we learn that rich gold bearing quartz have been discovered near the summit of the mountain west of this city, somewhere in the vicinity of King's Cañon. The discoverers have made arrangements to record their discovery in our issue of Tuesday morning. As the depreciation and rise of the price of mining stocks is a matter of considerable interest to our readers, we propose to publish, as often as convenience will permit, a revised and corrected list of the value of mining stocks in our territory, together with the sales as far as we can learn them. We rely, somewhat, on the owners and purchasers of stock, who will forward to us over their own signature, the prices at which they are buying and selling, so far as they could be ascertained, from any regard as reliable sources, a list so our readers will be enabled to correct any apparent errors, they will do us about mentioned.

Saturday, Sept.-21 1861.

Five feet Mammoth Lode, Sold at \$70 per foot.

WASHINGTON TERRITORY.

Stanislaus county.—A vein of auriferous tellurium, seven feet thick, has been found in the Stanislaus county. It yields to the ton, \$39 in gold and \$31 of silver.

Lenoir's Gas-Engine.

The machine in question somewhat resembles the ordinary steam engine, but its motive power is obtained by the combustion of the ordinary illuminating gas, mixed with atmospheric air. In certain proportions this mixture is explosive, as gas-engineers well know. But in Lenoir's machine, the denoting proportion of two volumes of gas to one, of air is avoided, and the highest combination allowed is one of gas to nine of air. Besides the two are not brought into contact till they have entered the cylinder, when they are ignited by a spark from a little Ruhmkorff apparatus, and the dilatation of the gases forces the piston forward with great force. When the piston reaches the end of the cylinder, it is carried back a little way by the momentum of the fly-wheel, opening a valve at the same time, and admitting another supply of hydrogen and air, which is ignited by an electric spark, and so the alternate motion is established. The whole machine is simple and beautiful, and the only question is as to its utility seems to be the very important one of economy.

On this point M. Lenoir states, (1), that the prime cost of his machine is only about half that of a steam-engine of the same power; and, (2), that even in using street gas, at the rate of \$1.60 per thousand feet, the saving of fuel, as compared with the steam-engine, is at least fifty per cent., and that they hope to obtain non-illuminating gas, which will answer the purpose just as well, at one-sixth of the price mentioned.

One disadvantage of the steam-engine is shared by M. Lenoir's, viz., all the heat generated cannot be converted into power. If there was nothing to hinder the complete expansion of the gases, the temperature of the expanded gas would be as low as before the combustion; but after a certain point of dilatation is reached the expansion force left is not sufficient to move the piston, and the air must then be turned into the waste-pipe, though still very highly heated. On the other hand there are several advantages claimed. Besides the low prime cost and the alleged economy of fuel, there is a great saving from the facility of starting the machine in an instant—certainly a very great advantage, considering the loss of time and fuel attendant upon raising steam. Then there is considerable expense involved in stopping a steam-engine, which is obviated here; the combustion in Lenoir's engine being stopped instantaneously by the turning of a button.

OREGON IMMIGRATION.—Letters received in Oregon say that the immigration is a month after the usual time of previous years, the main body having been at Fort Laramie on the 6th of July. There were two thousand wagons traveling in a compact body.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For parting silver from gold when gold

is below 300-1000ths. fine. 3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " .14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz, and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

PURE NATIVE SONOMA WINES.

RED, WHITE, AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them to the market, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma. M. G. VALLEJO.

At the depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo, for specimens of his Wines exhibited at the various Fairs held in the different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by

A. S. LOWNDES & CO., Agents,

617 Montgomery street, opposite Montgomery Block, San Francisco.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$15.
Durgan, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caney Ledge, \$25.
King Charles, at Flowry, \$6.
Edgar Co., Great Western Ledge, Helena, \$20.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.

[Having completed all the requisite arrangements, I lay before our readers a reliable list of prices of mining stocks of Utah.]

PIONEER RIDING ACADEMY

LIVERY AND SALE TABLES,

Nos. 207 and 209 Montgomery street, one door from Jackson, San Francisco

ORRICK JOHNSON

PROPRIETOR.

Horses kept on Livery.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street.

MASSEY & YUNG.

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FINE CLASS PHELAN'S TABLES, will be opened for business on SATURDAY, 31st, 29th, 1861. The undersigned respectfully solicits the patronage of all GENTLEMEN Billiard Players, and hope by conducting their Saloon in an unexceptional manner, to merit their continuance and support.

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING,

..BUT THE BEST FOR..

MANUFACTURING CLOTHING

..AND..

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cassimere and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them cannot be surpassed.

Various styles of Machines have been employed on the above materials, but the Wheeler & Wilson is preferred.

DONALD McLENNAN,
Proprietor of the Mission Woolen Mills

July 6

DISTRIBUTION OF IODINE.—Chatin, the well-known French chemist, insists that there is iodine in the atmosphere. He found it in the rain water of Florence, Pisa and Lucca, as well as at Paris. Further, he adds that he has found in five samples of distilled water, and three specimens of tannin from the best laboratories, and he believes that it is found in all potassiums and most rain-waters. M. Chatin cannot succeed in isolating the iodine, but he feels the less certain of its presence.

The Miner's Gold and Silver Saver! By Letters Patent.

We have just sent on drawings, specifications, and applications for Letters Patent, to Washington, for the above apparatus. Among modern inventions and discoveries, we venture to say no other can compare for its complete and thorough application, and its general principles. The models which we have duplicates are now to be seen at the office of this journal, and are open to the examination of those acquainted with metallurgical operations. In our opinion, we must admit that it is the only one based upon strictly philosophical principles; overcoming all short comings of the known amalgamating processes and methods. We are satisfied it must work to within five per cent., although it claimed by the inventor that it will work the ore—iron ores or sulphurets, both Gold and silver to its standard value of precious metals. The machinery or apparatuses are simple and easily constructed, and not so expensive as others. The inventor is now on his way to Esmeralda, where he is practically employing this invaluable process. Information, or purchase, or right of use may be effected with the Editor of this journal.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supercede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that, 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silverthorn, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of May, see your newly improved Cam Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

Yours, truly,
G. W. HAMMETT, A. BALDWIN,
M. CROGER, CHARLES MCCARRON,
D. R. MEACHAM.

June 12th, 1860.

MR. STANDISH—Sir: Your Mower was tried in my eleven meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harnett's field, and I am pleased with its performance. The cam wheel power over the cog wheel, for driving a reaper knife, has a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging-bearings and hexes, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,

ELAM BROWN.

PACHEGO, June 23, 1860.

MR. STANDISH—Sir: This is to certify that I have operated one of your mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife clover, or eat any grass.

Witness: Washington A. Wilson, W. T. Hendrick.

LAFAYETTE, June 27th, 1860.

MR. STANDISH—Sir: I saw your mower at work in down clover and only very heavy growth; it performed better than any mower I have ever seen for simplicity, durability and lightness of draft, it certainly has not its equals. Respectfully, yours

WARREN B. ADE

PACIFIC FOUNDRY AND MACHINE SHOP. First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp-Sizes and Dies of iron, which is imported by us expressly for this purpose; its peculiar hardness making shoes and dies last two or three months. Blading Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mulley, and Circular Saw Mills; Sling Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these sling machines can be seen in operation in Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Saut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Linn's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Opbir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson, }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- 12th. We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munu & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the Inventors of the United States.

On the Movement of Fluid in Porous Bodies.

Among the topics of scientific interest which awaken attention at present, is the research of Jamin, professor at the "Ecole Polytechnique," upon the equilibrium and movement of fluids in porous bodies. The new results at which he has arrived afford an explanation of the ascent of sap in vegetables without the necessity of recourse to the vital force. It is apparently a question of capillarity only.

Jamin has applied the new facts which he has discovered to the construction of an apparatus composed entirely of inorganic materials, but showing in its structure a great analogy with vegetables.

This apparatus has the property of raising water, as trees do to a height greater than that attained by means of atmospheric pressure, from a moist soil, whence the water is constantly drawn to the factitious leaves, where it is continually evaporated.

Reduced to its most simple form, this apparatus is composed of a block of some well dried porous substance, as chalk lithographic stone, etc., or a porous battery cell filled with a powder well rammed in, white chalk, for instance, oxide of zinc, or even with earth. A manometer is imbedded in the interior of the mass, and the whole is plunged into a vessel full of water. The water immediately penetrates its pores and drives out the air, which collecting in the interior exercises a pressure upon the manometer amounting with oxide of zinc to five atmospheres, and with starch it exceeds six atmospheres. This is not the limit of the greatest possible pressure; Jamin makes known the causes which diminish it in these cases, and proves that the water is forced into porous bodies with a force which he calls *n*, and which is equal to that of a considerable number of atmospheres. A tube 1.20 metres long, filled with plaster and terminated at the summit by an evaporating surface is inserted by its base into a reservoir closed and filled with water; a vacuum is caused, measured by fifteen or twenty millimetres of mercury, or by two hundred or two hundred and seventy millimetres of water; and the water appears even at the upper extremity of the tube—which proves porous bodies are able to raise water higher than can be done by atmospheric pressure.

These facts cannot be explained by the ordinary laws of capillary attraction, since these bodies are not formed of impermeable tubes, but of corpuscles in juxtaposition, separated by small empty spaces. Jamin has therefore submitted the problem to the calculus, and has come to results, of which we mention the following:

If, in a damp porous body, the water is compressed by a power of several atmospheres, it can coagulate only at a temperature below 0° C. Consequently old wood is able to resist frost, while young shoots being less dense, are unable to do so.

Since water in filtering through a porous body, is compressed as it enters, and dilates again as it runs out, it should exhibit electric currents and many other phenomena.

The theory cannot be applied to non-homogeneous porous bodies. In the extended memoir which he has prepared Jamin discusses the complicated results which may be occasioned by irregularity of structure; he makes an application of it to wood, and shows that the interior pressure must be augmented in the denser tissues; that the air must come from the larger tubes, which cannot serve for the ascent of the sap.

It is plain that the evident tendency of these experiments is to explain the ascent of the sap in vegetables by capillarity. The idea is not new, but it has not been hitherto fully admitted, notwithstanding the experiments which have been heretofore made.

Jamin gives it probability in showing by decisive experiments that porous bodies exercise a capillary action superior to the pressure of the atmosphere; further, he gives the physical theory of capillarity in porous bodies, and succeeds in calculating the phenomena of the movements of liquids in trees.

New Micrometer for Measuring Large Distances.

At a recent meeting of the Royal Astronomic Society, England, Mr. Alvan Clark, of Boston, Mass., exhibited a micrometer, invented by himself, which is capable of measuring any distance up to about one degree. It is also furnished with a position-circle. Its character is essentially the same as that of the parallel-wire micrometer; but it has some peculiarities, not, it is believed, previously introduced, and on which its wide range depends. The most remarkable of these peculiarities consists in its being furnished with two eyepieces, composed of small single lenses, mounted in separate frames, which slide in a groove, and can be separated to the required distance. A frame carrying two parallel spider-lines, each mounted separately with its own micrometer screw, slides in a dove-tailed groove in front of the eyepieces; and by a free motion in this frame, each web can be brought opposite to its own eye-lens. In using the micrometer the first step is to set the position vernier to the approximate position of the objects to be measured. The frame containing the webs and their micrometer screws is then slid into its place; and the webs having been separated nearly to their proper distance by their free motion in the frame, they are placed precisely on the objects by their fine screws, the observer's eye being carried rapidly from one eye-

lens to the other a few times, till he is satisfied of the bisection of each of the objects by its own web. The frame is then removed for reading off the measure by means of an ochromic microscope, on the stage of which it is placed. One of the webs is brought to the intersection of cross-wires in the eye-piece of the microscope; and by turning the screw, the revolutions of which are counted, the frame travels before the microscope, and the other web is brought to the intersection of the cross-wires. The parts of a revolution are read off by a vernier from a large divided circle attached to the screw. The advantages arising from the peculiar construction of this micrometer are the following:

1. Distances can be observed with great accuracy up to about one degree, and the angles of the position also.
2. The webs being in the same plane, are free from parallax, and are both equally distinct, however high the magnifying power may be.
3. The webs are also free from distortion and from color.
4. A different magnifying power may be used on each of the objects; which may be advantageous in comparing a faint comet with a star.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.
Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALOES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, 888 ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.
All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them THIRTY PER CENT. CHEAPER than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.
The wholesale department of this House is on Sansone street, occupying the whole block from Clay to Commercial street.

Geyser Spa Springs.—The water of the celebrated Geyser Springs has been analysed, by Dr. Lanzweert, of this city, and found to contain the following properties:

Bi Carbonate of Soda	4.87 grain
" " magnesia	2.45 "
Carbonate of iron	95 "
Carbonate of lime	1.24 "
Chloride of sodium	2.39 "
Sulphate of soda	85 "
Silica	45 "
Loss	08 "
Carbonic acid gas free	

The spring is owned by Messrs Casey and Kelly of Sacramento City, intend introducing the water into general use. Messrs. Graham & Conham are the agents for this city. It can be furnished to saloons and private families as cheap as ordinary soda water.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, OCTOBER 5, 1861.

NO 3.

HAVING observed the great want of a cheap, simple, and efficient process to save fine gold, and having had experience in the electro process in England, and of amalgamation in this country, I made a machine and tried the experiment of amalgamating by magnetic electricity, and found that it answered my every expectation, as the action of electricity upon quicksilver gives it a much greater affinity for other metals, and causes it to take up every particle of gold that comes in contact with it, however fine or dirty.

I therefore applied for a patent, dated 11th February, 1861. In every plan of amalgamation up to the present time, there has been a loss of gold, owing to the quicksilver not having in itself sufficient attraction to take up the finer particles and dirty gold, it therefore floats away with the sand and is lost. The process I have invented will overcome the difficulty; and as all the quartz or other substance is forced through the quicksilver, it must of necessity be brought in contact with it.

In laying my process of amalgamation before the public, I wish to show that it has advantages over every other now in use, as it is both simple and effective in operation; and when the magnetic machine is once fixed cannot get out of order, the amalgamating apparatus can be attached at little expense to any machinery in use for the attraction of gold. One magnetic machine will be sufficient for four or six batteries of stamps, and any one accustomed to crushing machinery can attend to it the same as to the common ripples, also saving much time in clearing off, as by taking out a plug at the end of the amalgamating trough, the amalgam can be drawn off in a few moments.

The process is as follows:—The quartz or other substance is stamped or crushed in the usual way, with water, the finer the better. On leaving the stamps it passes down a shoot, (A) 30 inches wide, placed at an inclination of about 40 degrees into a trough (B) containing quicksilver, through which a stream of magnetic electricity constantly passes, and is forced under bridge (D) and through the quicksilver by its own pressure; the passage of the quartz through the quicksilver is regulated by screws (E) to prevent breaking the quicksilver by too rapid a passage. The tailings then pass over a copper plate (C) into a trough (F) to be carried away; this plate is placed in connection with the quicksilver to prevent any floating away.

The electricity is obtained from fixed magnets worked by a band from a pulley on the main shaft of the engine, to a small pulley (H) on the magnetic machine (G).

The electricity is conducted from the machine and connected to the quicksilver by means of wires (shown by dotted lines). The magnetic machine may be put in any convenient place free from damp, and will not require any extra power in the engine. This process of amalgamation can be applied to washing, puddling, or wherever motive power can be obtained.—G. W. T.

Water obtained from the Soda Springs on the new Sacramento road to Yreka, above Red Bluff, makes a pleasant effervescent drink after being bottled.

G. W. TONGUE'S PROCESS OF AMALGAMATION BY MAGNETIC ELECTRICITY.

New Music.

NEW INVENTION OF A LABOR SAVING DRILL.—We observed yesterday in the Pavilion a newly invented drill for mining and other purposes, which we consider one of the most important inventions which has been made on this coast. It is a drill fixed in an iron frame, and so arranged that it presses against the rock, while a swinging hammer strikes the blow which sends it in the rock. It is so arranged that the drill may be raised or lowered at a space of three or more, and directed, from a horizontal to a perpendicular position. It is a great labor-saving machine, it requires the labor of one man only, and can do as much execution as three or four working the old system. The iron sets upon wheels, and it can be easily moved. The inventor, Mr. French, of North San Juan has it on exhibition. We learn that it has been used in a tunnel, in the vicinity of that place, and did good work.—Express.

COPYING PAPER.—Copying paper, into the body of which a certain proportion of protosulphate of iron (copperas) has been introduced, either during the manufacture or afterwards by passing it between rollers covered with felt impregnated with a solution of salt, is much more advantageous in use than the common paper. A letter written with common ink, containing an infusion of nutgalls, or having the tannin-gallate of iron for its base, and covered with the above copying paper, gives, by means of the press, a perfect fac-simile. If a little sugar or pro-gallic acid is added to the ink, a good copy may be had by pressing lightly the copying paper upon the latter without the use of the press, taking only the precaution to interpose between the hand and the sheet of copying-paper another sheet of oiled paper, over which the rubric must be done.

Prof. G. A. Scott has laid upon our desk a number of pieces of music, which he composed and partly published here, and in Boston. The texts are furnished by one of the Twelve of which Scott is the *Capellmeister*. We have neither space nor time to give an extended criticism, but from the hasty perusal we have had, it is evident that the Prof. possesses latent genius as a musical composer. Thus far we have seen but miscellaneous melodies by him. If some more extensive work on subjects of the present day could be entertained by him we should like to hear from him.

RARE VIOLINS.—At a recent sale of musical instruments in London, such prices were realized as £81 for a Stradivarius £48 for another violin by the same maker; £84 for an Amati violin (formerly the property of Sir W. Carr.) The violoncelli fetched lower prices; an instrument attributed to Joseph Guarnerius brought £50; another by Stardivarius, was secured by Signor Piatti for £50.

NEW VOLCANO IN WASHINGTON TERRITORY.—A volcano has made its appearance upon the summit of a mountain on Hood's Canal. The blaze could be seen from the deck of vessels at sea, and was accompanied by a rumbling noise.

HUMBOLDT ORE.—An assay of silver ore taken to Red Bluff, and thence to San Francisco, yields \$53 78 in silver to the ton, with a mere trace of gold.

NEW SILVER ALLOY.—A beautiful alloy is stated by foreign contemporaries to have been invented recently, after many experiments, by Messrs. De Roulz and De Fontenay, France. It is said to be well adapted for small coins and industrial purposes. It consists of one third silver united with twenty-five to thirty per cent. nickel, and from thirty-seven to forty-two of copper. Phosphorus is used as a flux in making the metals combine, but when first made and cooled it is very brittle. To render it ductile the phosphorus must all be removed by reheating, after which the alloy resembles a simple metal, and presents in a very high degree the qualities to which the precious metals owe their superiority. It resembles platinum and silver of 800-1000 in color, it takes a very brilliant polish. Its tenacity and hardness are extreme. It is ductile, malleable and very difficult of fusion, very sonorous unalterable in the air, and attacked only by the most energetic re-agents. It has no odor and its specific gravity is but little inferior to that of silver. It is easy to estimate the important part such an alloy is calculated to play in the industrial arts, and especially in the silversmith's art—in, to a great extent, replacing silver, of which its price is forty per cent. less, and as its hardness gives it a marked superiority. Again, articles which are merely silvered or gilt have, it is true, a great advantage in their low price; but they quickly deteriorate, and can be re-silvered or re-gilt only a very few times, after which they must be replaced by new ones, and, in the long run, entail such an outlay as to confirm the old adage, that the cheapest is the dearest in the end.

Characters of Minerals.

Let no presuming impious reiler tax
Creative Wisdom ; as if ought was formed
In vain, or not for admirable ends,
Lives there the man whose universal eye
Has swept at once th' unbounded scheme of things,
Mark'd their dependence so, and firm accord,
As with unfaltering accent to conclude
That this availeth nought ?—
Till such exist, let zealous praise ascend,
And hymns of holy wonder to that Power,
Whose wisdom shines as lovely on our minds,
As on our smiling eyes his servant-sun.—

Thomson.

The characters of minerals are divided into two sections viz. physical and chemical. The former section comprises such characters as are readily observable by the eye or by some more or less simple mechanical experiment, whilst to the latter section belong those characters that require for their recognition the application of some chemical process or series of processes, often of a most complicated nature. On one or other of these divisions of character it is necessary that the mineralogist should found the arrangement of his specimens, in order that he may readily occur to any particular substance or individual that he may require. We will therefore proceed, in the first place briefly to comment upon those characters included in the first-named section, of which the following is a list:

Adhesion to the tongue.	Magnetism
Color.	Odor.
Double refraction.	Phosphorescence.
Elasticity.	Powder.
Electricity.	Specific gravity.
External form.	Streak.
Flexibility.	Structure.
Fracture.	Taste.
Frangibility.	Touch.
Hardness.	Transparency.
Lustre.	

Adhesion to the tongue may be observed in Lithomarge, and particularly in a kind of lamellar clay which is found near Paris, and is termed adhesive slate, from its possessing the property of adhering to the tongue. It is not a character of common occurrence.

The *Color* of a substance, though it may add considerably to its beauty is not a character upon which much dependence can be placed, as the hue of a mineral frequently depends upon the accidental presence of an ingredient in such small quantity as to be insufficient to alter the general characters of the mass. The numerous varieties of quartz, for instance, present an infinite succession of tints to the eye, though their composition and form are identical. The colors of minerals are perfectly attributed to the influence of the sun, an idea in which there may be some portion of truth, since it is well known that if a nearly colorless piece of precious opal be placed in a position to receive the sun's rays for some hours it will frequently be found to have assumed the most brilliant play of colors.

At times the ruby lights its deepening glow,
And with a waving radiance inward flames.
From thee the sapphire, solid ether, takes
Its hue cerulean ; and of evening tint,
The purple-streaming amethyst is thine.
With thy own smile the yellow topaz burns ;
Nor deeper verdure dyes the robe of spring,
When first she gives it in the northern gale,
Than the green emerald shows. But all combined,
Thick, through the whitening opal play thy beams ;
Or, flying several from its surface, form
A trembling variance of revolving hues,
As the sight varies in the gazer's haud.—Thomson.

There are, however, many minerals of which the color is a distinguishing characteristic.

Double refraction is a character not frequently possessed by minerals. It is best shown in the transparent variety of carbonate of lime known by the name of double-refracting spar.

Elasticity and Flexibility. If a piece of mica be bent, it will, on its being released, spring back to its former shape, and is therefore an example of elasticity ; tale, however, is only flexible, because, when bent into any form, it retains that form, instead of regaining its previous position.

External form and structure. These two characters combined, form a distinct branch of the study of miners, termed Crystallography. They are the most important of the physical characters, and the only ones upon which a physical arrangement of specimens could possibly be founded. The subject, however, is of such unbounded extent, that it would alone fill many a scientific and pleasing volume ; and, indeed, whilst such a work as Brooke's Familiar Introduction to Crystallography exists, it would be as useless as it would be presumptuous were we to attempt to do more than notice one or two of its principal features.

A crystal is a symmetrical solid, bounded by plane surfaces, and is composed of minute particles or molecules, of a determinate form ; acted upon by certain laws of attraction, cohesion and polarity, these molecules, combined, assume the great variety of crystalline forms that are to be observed in mineral substances. Numerous, however, as these are, they are all said to be derived from some few simple forms, and

are therefore termed secondary forms, whilst those from which they are derived are termed primary forms. The most simple form to which a substance may be reduced by cleavage, may therefore generally be termed its primary form, from which all the modifications presented by the crystals of the substance are derived.

Of these primary forms the following may be commonly seen in well known minerals.

The *Tetrahedron* consists of four triangular planes. This form may frequently be seen in blende and in copper pyrites.

The *Cube* is contained within six square planes. Very perfect cubes of iron-pyrites and of fluor-spar can be easily obtained, as it is the most common form of those substances.

The *Rhombic Dodecahedron*, a crystal composed of twelve rhombic planes. Of this form the common garnet is a good example.

Of the *Octohedron*, which consists of eight triangular planes, there are three varieties, viz. the acute, the obtuse, and the regular octohedron. This last is the most general, and may be observed in iron-pyrites, spinel ruby, and numerous other substances.

The *Hexagonal Prism* is the form of Beryl and of Emerald, and is the general form of quartz, although its primary form is the rhomboid.

The *Rhombohedron*, of which there are several varieties, may be observed in double refracting spar. The difference between this form and the cube will be readily seen if the two forms are placed next to each other ; but we may observe that, of a rhomboidal plane, two of the angles are acute and two obtuse, whereas the four angles of a cubic plane are all similar.

All of these forms, however, though very distinct, the one from the other, are said to pass into each other. This curious and interesting fact may be proved to the satisfaction of the learner in a practical and simple manner, by his procuring a piece of clay, or even potato, and having formed therefrom a cube, let him proceed to remove all its corners, or solid angles, with as much regularity as possible. He will then have the cubo-octohedron, so termed because the triangular planes which are produced by the removal of the solid angles are in reality the planes of the octohedron, which will be seen by gradually removing more and more of the corners, until the cube no longer appears, being replaced by a regular octohedron. With the same humble materials the manner in which the other forms pass into each other may be witnessed. In order, however, to become well acquainted with these most interesting transformations, a set of models of the crystalline forms and their modifications should be procured.

The dimensions of crystals are exceedingly various even in the same substances. Some of the crystallizations of quartz, for instance, are so minute that they present to the eye only a condensed mass of sparkling drusy appearance, while others, particularly rock-crystal and amethyst, attain an enormous size. In the British Museum may be seen a well formed rock-crystal upwards of a foot in length, and of proportionate diameter ; others are known to exist of much larger size. The Irish Amethyst is usually found in very large crystals, some of them being about eight inches in diameter. Crystals of beryl, presenting the regular form of that mineral, have been found in America towards of two feet in length ; these immense crystals, are usually opaque, or nearly so, the ordinary length of the transparent crystals not exceeding two or three inches.

Again, perfect dodecahedrons of common garnet occur sometimes of very large dimensions—some we have seen measuring full seven inches in diameter ; as in the former case these very large crystals might be mentioned ; but those already enumerated will be sufficient to suggest the reflection, that the laws of nature are exhibited as perfect and universal in the crystallization of mineral substances, as in those operations of nature that are apparently of more general interest, or, at least, that are more generally understood ; and that the regularity of those laws is as plainly to be observed in the most minute and the most gigantic crystallizations, as in the greater or lesser phenomena of the animal or vegetable kingdoms.

The *Structure* of a great number of substances, in addition to their regular crystalline form, permits of their being broken or split in various directions, so as to produce forms similar to the natural crystals. The surfaces thus obtained are termed cleavage planes, according to which the primary form of a substance is often ascertained. Take, for example, a rough piece or a crystalline cube of fluor-spar, and placing it in a convenient position on the table, apply the edge of a common table knife to the portion to be removed, tapping the back of the knife smartly with a light hammer ; by this means the tetrahedron, and the rhomboid, may be produced. Blende, again, may be cleaved into a variety of forms, such as the rhombic dodecahedron, a rhomboid, an octohedron, and the tetrahedron. Iceland spar, also, affords a capital illustration of structure, and may be cleaved into most perfect rhomboids.

Crystals have been said to bear the same relation to the mineral kingdom, as flowers do to the vegetable. Each gives a charm to its respective study, which is perhaps necessary to secure for it that degree of attention it deserves. Before we become complete enthusiasts in any one branch of science we must see in it some beauty to attract us—some source of superficial gratification, to tempt us to explore its winding

paths ; and unless that gratification be constantly renewed, we are apt to become careless and apathetic in following them.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining ; timbering in shafts and mines ; metals: their chemistry and geology ; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento :

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits ; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows : 1st. On the nature of deposits of the metals and ores, and the general principles and processes of mining ; 2d. Method of Mining and Metallurgy ; 3d. Metals—their chemistry and geology ; 4th. Improved System of Assaying ; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans ; 6th. Placer Mining ; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—(Morning Call.)

A BOOK FOR THE MINES.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide," a compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer ; together with a comprehensive glossary of technical phrases used in the work. It is a neat dodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character ; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—(Herald.)

THE MINER'S COMPANION AND GUIDE.—In a recent notice of this invaluable work, we omitted to give some of its leading features of interest and value specially designed for our mining community and metallurgists. This book has been carefully prepared and published by the enterprising editor of the "Mining and Scientific Press," of San Francisco. It contains nearly one hundred fine illustrations, with three hundred pages of interesting and instructive matter, forming a neat little volume substantially bound, at the low price of two dollars. It is thus far the best mining work issued on this coast, having complete treatise on veins and lodes, timbering of mines, manual of metallurgy, the geology of California, and the most important of all, many new and interesting methods for separating gold and silver ores, and pyrites, together with a glossary of technical terms not contained in any other work. The miners of this coast will find this an indispensable hand-book. Every California prospector should possess it.—(Sac. Bee.)

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer ; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins, and the manner in which the ore or rocks taken out. The second chapter, of 33 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the names of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the solution of silver ores, is a useful information together with a glossary, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.]

NEW BOOK RECEIVED.—The publisher has laid before us the following work just issued by him : The "Miner's Companion and Guide," with illustrations. 24mo. pp. 232. San Francisco. J. Silversmith. 1861. This work gives information to the prospector, miner, geologist, mineralogist and assayer. It contains also a glossary of technical phrases used in the work. The volume appears to be clearly written, and no doubt contains much valuable and interesting information. The numerous wood cuts help materially to illustrate the text.—[Bulletin.]

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and usefulness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's rugged soil its hidden treasures.—[Union Temperance Journal.]

BOOK DEALERS and others will please send orders through mail or express to the office of this Journal.—Liberal percentage allowed.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connection with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleaning grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plater or runner of each set is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane then into the first blast from the fan at the bottom of the machine, which takes out most or all of the Smut Balls, Oats, Chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilante and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals,—whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and that he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off in to a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. S. LIVERSMITH, proprietor Mining and Scientific Press, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being self-feeding and self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee, J. B. BEERS.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facilities for completing and carrying out Inventive and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

WILLIAM A. BURKE,

TO GOLD AND SILVER MINING COMPANIES.

The Pacific Metallurgical Works, North Beach,

are now prepared to crush all kinds of Rock or Sulphurets, and of a suitable fineness for sale or reducing. For terms, etc., apply to BRADSHAW & Co., Agents, Cor. of California and Sansome sts. my17.

HUNT'S

IMPROVED FIRST PREMIUM WIND MILLS!

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 208 & 201 Jessie street, SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware, and of this city.

PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125. ap19 E. O. HUNT, Builder.

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000

IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.

The books of subscription are open at the office of Pioche & Bayerque where the required first installment of 10 per cent. will be received. F. L. A. POCHE, President.

AGENCY FOR PATENTS.—The undersigned having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Patents and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,

Office, Market street opposite Montgomery

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS. DAN LYNCH, 720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and salesroom for

Phelan's Patent Combination Cushions and Model

Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables

BERGER'S BIJOU BILLIARD TABLES,

WITH PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition a

Phelan's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine it. The Great Master, Mons. Berger, speaks of the Tables in the highest terms of commendation. To private families the Tables command themselves, especially on account of their convenient size and as an article of furniture for a private dwelling there is nothing more desirable; in short, no household or mansion with any pretensions to be well regulated, should be without one. Gentlemen about to build residence should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful and health-giving game of billiards.

M. E. HUGHES, Billiard Table Manufacturer, And Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc.

729. Exhibition and Salesroom, No. 720 and 722 Montgomery street 729. Manufactory, Market street, opposite Orphan Asylum. jy13

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....OCT. 5 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. Stereotyping and Electrotyping, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York *World*, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

The Sacramento State Exhibition.

Agreeably to a kind invitation tendered us through the Secretary, O C Wheeler Esq., of the State Agricultural Society, to this fair, we repaired to the capitol. It had been some months since we visited Sacramento, and had not then the leisure to see much of its beauties or the progress it had made since our residence there, in 1852, even then a very thriving inland metropolis. We were well repaid for leaving our precarious tripot for the few short days which we whiled away in 90° Fahr. which brought back recollections of "former dog days." We were indeed much pleased with the general aspect of this sociable and pleasant town, together with its many new and beautiful structures of commercial and private residences, all of which are most gorgeously adorned with gardens, trees, flowers, some of which are decidedly fantastic and unique. The inmates too, are so very sociable, polite and kind, as to make one feel quite at home, and lost to all cares of business. Here we had no "duns," no "Compositor crying out for copy;" we may say that we felt like a "god in France."

THE PAVILION.

The beginning of the exhibition was announced to be opened on Monday, but did not really begin till the following Wednesday. This edifice has one of the largest halls in the State, and on this occasion was well arranged with tables and stands for exhibiting the different articles. We

cannot say much for the mechanical department which was scarcely well represented; this may easily be accounted for, since the existing war excitement and general depression in financial matters, as well as the holding of many other exhibitions elsewhere, retarded many from entering their goods or wares, which is otherwise attended with considerable expense and time. Fruit, immense vegetables, flowers, and horticultural products made up for this deficiency at the pavilion, which was attended by many, not a few of them fair ladies that flocked from far and near, which gave it life and zest. Indeed our eyes often feasted on rustic maidens, whose blushing eyes and crimson cheeks seemed reared in fertile valley, or mountain glens.

Among the most important machines and implements we noticed Mr. Donahue's fire engine, Matteson's hydraulic derrick, Tustin's reaper and mower, a sower, by Messrs. Knapp, Burrell & Co. (of this city), Hansbrow's pump, Howard's hydraulic hose sewing machine (of Marysville), Pomme's grain separator, Selfridge's pump (rotary) a steam sewing machine by Mr. Donahue of this city, Coleman's quartz crushing mill, Wells do., a huge bell from Messrs. Conroy & O'Connor of this city, etc., all of which we believe received the first premium.

THE STOCK GROUND.

This part of the fair, capped the climax over all others heretofore held in this State. We were particularly pleased, as we are fond of a good horse. The races formed excellent inducement for amusement and a remuneration to the society. We have neither time nor space to give names or details of these, but we have come to the conclusion that California is the most prolific country for propagating the species in the animal and vegetable kingdoms.

The affair closed with a brilliant ball, in which we participated to our great satisfaction. The splendid large hall covered with white cloth, served to make toes glide glimly; the music too, was superb, and many San Francisco ladies helped to array the splendore of the festive scene with their smiling countenances. At a late hour, with the glowing compliments from our late partner in a waltz, we might have been seen to emerge from these gaieties.

Gen. Siegel's Portrait.

We are under obligations to Chas. C. Western, artist, for a splendid lithograph of our illustrious hero, Gen. Siegel of Mo. It is well executed and colored, and will no doubt adorn the walls of all true Union sympathizers, but especially those of our brother Germans.

The Miner's Gold and Silver Saver! By Letters Patent.

We have just sent on drawings, specifications, and applications for Letters Patent, to Washington, for the above apparatus. Among modern inventions and discoveries, we venture to say no other can compare for its complete and thorough application, and its general principles. The models of which we have duplicates are now to be seen at the office of this journal, and are open to the examination of those acquainted with metallurgical operations. In our opinion we must admit that it is the only one based upon strictly philosophical principles; overcoming all short comings of all the known amalgamating processes and methods. We are satisfied it must work to within five per cent., although it is claimed by the inventor that it will work the ore—iron pyrites or sulphurets, both Gold and silver to its standard value of precious metals. The machinery or apparatuses are simple and easily constructed, and not so expensive as most others. The inventor is now on his way to Esmeralda, where he is practically employing this invaluable process. Information, or purchase, or right of use may be effected with the Editor of this journal.

The *Silver Age* is in error when it surmises that J. E. Clayton Esq. is the inventor of the above highly important process. We know the gentleman personally, and that he is actively employed in perfecting some improvements on the Veatch Process. For good and weighty reasons do we withhold the name of the inventor, as well as the *modus operandi*, till our patent papers and other important arrangements have been completed. It will be the method or process for many years to come, being simple, practicable, labor-saving and economical in all its workings and details.

BOUND FOR THE RUSS DISTRICT.—Chas. F. Powell, Dr Mills and Mr. Haverty, members of the Union Gold and Silver Mining Co., arrived from San Francisco last week, and left Visalia yesterday for the "Russ District"—situated near Owen's Lake. They go by one of the near trails recently opened, by the Yokol Valley.

COAL.

Imports from January 1st to September 15:			
Anthracite, tons.....	16,903	Sydney, tons.....	11,304
Cumberland cks.....	1,144	Japanese tons.....	25
English, tons.....	14,165	Vancouver I. tons.....	4,536
Chili, tons.....	9,135	Coast, tons.....	11,384

The sales of 3000 tons Anthracite, to arrive, which occurred some little time since, and were not made public, are the only transactions of moment which have come to our knowledge. They were effected at \$18 @ 19 ¢ ton, with some slight resales at \$20. Our quotations give a true index of the market.

Accidents in Coal Mines.

The usual annual reports of the government inspectors of coal mines in Great Britain—those relating to the casualties which occurred in 1860—have now been printed. They show, unhappily, that although the number of separate accidents exhibits a diminution of nearly five per cent. as compared with the preceding year, the deaths resulting therefrom have increased to the fearful extent of more than twenty-two per cent. Upon the whole, however, the reports cannot be regarded as unsatisfactory, there being a general diminution in the number of deaths, with the single exception of those from explosions; and as to the casualties under this head, it is but just to remark, that the difference is attributable to the occurrence of three destructive explosions, in districts usually almost free from this class of accident. Taking the amount of coal raised in 1860 at 72,000,000 tons, which is very nearly the truth, it appears that one death occurred for each 64,924 tons of coal raised. The proportion of deaths from each class of accident was:—From the explosions from fire-damp, one death for each 198,347 tons of coal raised; from falls in the mine, one death for each 185,567 tons raised; from accidents in shafts one death for each 396,604 tons; from miscellaneous accidents underground, one death for each 1,333,333 tons raised. Again, the reports under consideration show that whilst the average number of lives lost for each 1,000,000 tons of coal raised during the five years 1859, was about 15.5, the number during 1860 was about 15.4, a circumstance which shows that, although the exceptional accident from explosions during the year reported upon, necessitates an unfavorable comparison with the preceding year, there has been a trifling improvement as compared with former years.

Complimentary Notices.

The following are additional complimentary notices of the "Miner's Companion and Guide,"—the first by the *Mirror*, the latter by the *Spirit of the Times*, both of this city, for which we tender our thanks:

MINING STATISTICS OF CALIFORNIA.—"The Miner's Companion & Guide," a compendium of valuable information for Prospector, Miner, Geologist, Mineralogist and Assayer. 1 vol., pp. 229. San Francisco. J. Silver Smith.

This interesting and valuable compilation, a copy of which was placed on our table some days ago, is just the thing for the miner, and for those whose interest are involved in that fascinating pursuit—fascinating in spite of the toil and drudgery which are its inevitable conditions, and the uncertainty which now elevates, now depresses the hopes of the ardent gold-seeker.—[*Mirror*.]

This is a small volume intended for the use of miners and others, containing a glossary of scientific phrases, dissertations upon the mineral deposits of the earth, together with the most approved methods of extracting ores and metals. The work is profusely illustrated with explanatory plates, and from a cursory glance we should judge it well calculated to answer the purpose for which it is intended.—[*Spirit of the Times*.]

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths fine.....3cts per oz.
 " from 300-1000ths. to 750-1000ths fine. 7cts "
 " " 750-1000ths to 950-1000ths " 14cts "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
 301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

PURE NATIVE SONOMA WINES.

RED, WHITE, AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them into the market, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma. M. G. VALLEJO.

At the depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo, for specimens of his Wines exhibited at the various Fairs held in the different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by

A. S. LOWNDE & CO., Agents,

617 Montgomery street, opposite Montgomery Block, San Francisco.

 Sunshine, \$16.
 Ohio and Buckeye Co. Argentine, \$12.
 Chimney rock, \$15.
 Dargen, \$10.
 Rich Co., \$3
 Miller, \$12
 Augusta, \$6.
 Spanish Co. Plymouth Ledge, \$6.
 Chelsea, \$8.
 Caney Ledge, \$25.
 King Charles, at Flowery, \$6.
 Edgar Co., Great Western Ledge, Gelena, \$20.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
 Ophir, 12; issue, \$300 per share.
 Gould & Curry, 4; issue, \$500 per share.
 Chollar, 4; issue, \$300 per share.
 Lucerne, 1; issue, \$500 per share.
 Mount Davidson, 4; issue, \$200 per share.
 [Having completed all the requisite arrangements before our readers a reliable list of prices of mining stocks of Utah.]

PIONEER RIDING ACADEMY

LIVERY AND SALE TABLES,

Nos. 207 and 209 Montgomery street, one door from Jackson, San Francisco

ORRICK JOHNSON

PROPRIETOR.

Horses kept on Livery.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street.

MASSEY & YUNG.

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE FULLY informed that their NEW BILLIARD SALOON, with EIGHT CLASS PHELAN'S TABLES, will be opened for business on SATURDAY 29th, 1861. The undersigned respectfully solicits the patronage of the Gentlemen Billiard Players, and hope by conducting their Saloon in an unusual manner, to merit their continuance and support.

PATENT

WIRE ROPE MANUFACTURERS

—AND—

Cable Suspension Bridge Builders.

OFFICE: WORKS:
2 Clay Street, North Beach.

WIRE ROPE IS FORTY PER CENT. LIGHTER, LESS THAN ONE HALF THE DIAMETER, AND SIX TIMES AS DURABLE AS MANILLA OR HEMP ROPE OF EQUAL STRENGTH, AND IS UNAF- FECTED BY CHANGE OF WEATHER.

It is more particularly adapted for FERRICK GUY ROPES, FERRY ROPES And for hoisting from Deep Shafts and Inclined Planes.

Using Companies or Ferry Owners, who use rope for winding, hoisting, or other purposes, will effect an immense saving by ordering WIRE ROPE through our Agents. Circulars, with scale of weights, sizes, strengths, and list of prices are sent, will be forwarded to those interested, who can then compare the cost of Wire and Hemp Rope, by addressing the manufacturers.

SUSPENSION BRIDGEWORK!
SUSPENSION BRIDGES, Aqueducts, Etc., erected on moderate terms PERMANENCY GUARANTEED.

DR. L. J. CZAPKAY'S

Private Medical and Surgical

INSTITUTE.

SACRAMENTO ST., Opposite P. M. S. Co.'s Office, SAN FRANCISCO.

Established in 1854, for the Permanent Cure of all Private and Chronic Diseases, and for the suppression of Quackery.

Attending and Resident Physician—L. J. CZAPKAY, M. D., Late in the Hungarian Revolutionary War, Chief Physician to the 20th Regiment of Honveds, Chief Surgeon to the Military Hospital at Pesth, Hungary, Late Lecturer on Diseases of Genito-Urinary Organs, and Diseases of Women and Children, and Honorary Member of the Philadelphia College of Medicine.

Particular attention paid to the treatment of Diseases peculiar to Women and Children.

OFFICE HOURS—From 9 A. M. to 10 P. M.
Communications strictly confidential. Permanent cure guaranteed or pay. Consultations (by letter or otherwise) free. Address,

Dr. L. J. CZAPKAY, San Francisco.

Spermatorrhoea.

Or local weakness, nervous debility, low spirits, lassitude, weakness of the arms and back, indisposition and incapability to labor and study, dullness of apprehension, loss of memory, aversion to society, love of solitude, timidity, listlessness, dizziness, headache, pains in the side, affections of the eye, pimples on the face, sexual or other infirmities in man, are cured by the justly celebrated physician and surgeon, Dr. L. J. Czapkay. His method of curing diseases is new, (unknown to others,) and hence the great success. All consultations, by letter or otherwise, free. Address,

Dr. L. J. CZAPKAY, San Francisco, Cal.

Between Street [Old Nos. 130, 132; New Nos. 422, 424].

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp-mills and Dies of iron, which is imported by us expressly for this purpose—is peculiarly hard and wears out last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hancock's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Saut Mills; Beller Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight

of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Refraction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.

2d. Having two driving wheels, if one slips the other does the work.

3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.

4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.

5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.

6th. When the machine is backed, the knives cease to plow, consequently you back away from obstructions, without danger of breaking the knives.

7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.

8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.

9th. It is mostly of iron, simple in construction, and a boy can manage it easily.

10th. It has no side draft.

11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing.

KNAPP, BURRELL & CO.,
ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munu & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

HENRY G. HANKS,

HOUSE AND SIGN PAINTER,

AND DEALER IN

PAINTS, OILS, GLASS, PUTTY, BRUSHES, etc. etc
321 Clay street, San Francisco.

HUNT'S, PATENT WIND POWER.

Among inventors on this Coast for useful and novel machinery, none will exceed the genius of the gentleman who heads this article. The accompanying engraving is another evidence of his inventive talent, as we will be able to show.

The peculiar advantages of this windmill are numerous and novel. Quite a number of them have been erected and now adorn the suburbs of our city. Mr. Hunt has made very many new improvements in the style and construction which materially facilitates its power, and overcoming other defects. This mill differs from others, since it receives the wind on the back of the crane, in which is contained the shaft and pulley with crank pin, to which are attached the connecting rod leading to the pump, the other to the lever or ratched pole for stopping the mill or regulating its motion, which rods is a part of the strip of iron immediately over the pulley. For simplicity, cheapness and durability, this mill exceeds many others already in the field. The latest improvements applied consist in the brake lever, containing a socket through which passes the square rod leading to the pump. The socket is held between two pivot clamps playing in journals around the socket. The lever as stated before serves to regulate the mill, which may be done by a boy of ten years; another important improvement is the flange or shoulders to which the sails or fans are fastened, a cast iron hub with nine shoulders, having holes for bolting said sails or fans.

The next and last improvement is the feather flange on the back of the sails or fans, which forms one of the greatest auxiliaries in wind powers.

A patent has been applied for through the agency of this paper. Further particulars will be cheerfully given by Mr. Hunt on Second street, near Market in this city.

Expeditions Journey to Japan.

Ever since Siebold and Thunberg visited Japan, have told us that among other beautiful plants the Scapety Verticillata, or umbrella pine, was the most beautiful tree in Japan. Since the country has been partly opened to Europeans, Mr. Robert Fortune the Chinese traveler, started last year in search of these plants, and has succeeded in an eminent degree. He left England on the 4th of August, 1860 by overland route, and arrived at Shanghai on the 30th of September; left Shanghai on October 3rd, arrived in Japan on October 5th, visited various parts of Japan, found the far-famed Sciodopetys, as well as a number of other fine plants, which are on their passage to Bagshot. Mr. Fortune enclosed a fine lot of seeds, sent them from Jeddo, November 6th, to Hong Kong, thence they were sent by post to England, reaching Bagshot on the 18th of January, 1861, and are now vegetating in Mr. John Standish's Royal nursery, and shortly will be fit for distribution among the lovers of hardy plants. It will no doubt prove hardy in this country, as its associate, Thuopsis Dolabrata, has proved to be perfectly hardy in this last severe frost.

EXTRAORDINARY EEL.—Mr. J. T. Rowthorn, on yesterday week, caught an eel in the Lower Hawksbury, measuring nearly eight feet, and weighing twenty-five pounds. On opening the fish it was found to contain one of its own species two feet in length, and a perch weighing a pound and a half, neither of which appeared to have suffered anything from the process of deglutition.—*Bell's Life in Sydney*.

BALLARAT BOTANICAL GARDENS.—At the council meeting, yesterday, letters were read from Dr. Mueller, announcing that he had forwarded a case containing 1,000 plants to the Botanical Gardens. These plants were applied for nearly twelve months ago by the Eastern Council, and will be handed over to them on application. Dr. Mueller describes them as being of great value.—*Times*.

A VALUABLE DISCOVERY.—Professor J. B. Turner, writes to the *Prairie Farmer*, that through a succession of experiments on himself, his children, his horses, and other cases, he has discovered that coal oil is a certain and speedy remedy for scrofulous eruptions and all kinds of local diseases such as rheumatism, pains in the side, shoulder, back and joints, croup, sore throat, bruises, strains, cuts, and laceration on men and animals. He mentions several cases in his own family, where the application of this oil gave instant and permanent relief; and finding its effects so beneficial, he has thought proper to make the discovery known to the public.—*G. V. National*.

A. KOHLER,
NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,
Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALOES, VIOLIN BOWS, ROW-HAIR, ROSIN, BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.
All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them THIRTY PER CENT. CHEAPER than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street.

Geyser Spa Springs.—The water of the celebrated Geyser Springs has been analysed, by Dr. Laazweert, of this city, and found to contain the following properties:

Bi Carbonate of Soda.	4 87 grains
" " Magnesia.	2 46 "
Carbonate of Iron.	96 "
Carboute of lime.	1 24 "
Chloriate of sodium.	2 39 "
Sulphate of soda.	85 "
Silecia.	46 "
Loss.	08 "

Carbonic acid gas free.
The spring is owned by Messrs Casey and Kelly of Sacramento City, who intend introducing the water into general use. Messrs. Graham & Cunningham are the agents for this city. It can be furnished to saloons and private families as cheap as ordinary soda water.

TEETH! TEETH!

Extracting without Pain! Dr. W. H. Lewis, Dentist, Third Street, near Howard (opposite Little's Mansion). All branches of Dentistry performed in the most perfect manner.

Extracting, each, \$1.
Extracting children's teeth, 50 cents.

Filling with gold, each \$1, \$2 and \$3.

Filling with platinum, each, \$1, \$2 and \$3.

Cleaning, whitening, a burnishing, \$2, \$3 and \$5.

Straightening, etc., from \$2 to \$5.

Nerves killed and Toothache cured, \$1.

Whole or partial successively and firmly adjusted on the finest gold, at \$10 (each tooth) \$5 to \$10.

On the best silver plate (each tooth) \$3 to \$5.

Montgomery street 60 minutes pass the office every five minutes. Special attention paid to Children's Teeth. Circulars, give full directions to patients for the preservation of Children's Teeth. Remember the place—Third Street.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, OCTOBER 12, 1861.

NO 4.

We present herewith another illustration of a new and novel method for amalgamation, and in our opinion one of great practicality and economy. Mr. Wm. Banham, the illustrious inventor, we believe will take the palm in discovering this valuable machine, as he has in his pans for pulverizing quartz, patented Dec. 27, 1859.

As will be seen in the cut, the ore is conducted through a cylinder into a vessel fitted to the large vat, in which mercury is contained; an electric or magnetic battery is situated in the vicinity, and the wires conduct electricity to the mercury; the ore or mass thus passing through this cylinder in a moist consistency is acted upon instantaneously; every particle or atom is taken up by the mercury, the residue or gangue passing through the mercury upwards, escapes through waste-pipes. The great difficulty *i. e.* concerning a film or covering in most quicksilver operations is hereby avoided. We have applied, through the agency of this paper, for a patent, and caution the public against infringement. For information or terms we refer the reader to Mr. Banham, in this city, to whom letters may be addressed through mail or express.

WM. BANHAM'S HYDRO-MAGNETIC AMALGAMATOR.

CHINESE LABOR IN NEVADA TERRITORY.—Mr. Teal has given notice in the Nevada Legislature, of an intention to introduce at an early day a bill to prevent Chinese labor from interfering with American labor in the mines. The feeling throughout Nevada is strong against the Chinese, there being some two or three hundred in the Territory, and the number continually increasing. This Chinese question is becoming an important one in all the new States and territories.—*Mirror*.

NEZ PERCE MINES.—A Correspondent of the Portland Advertiser, writing from Pierce City, Nez Perce country, says: Quite an excitement took possession of our population a day or two since. In digging a public well, in front of the Pioneer Hotel, in Main street a rich strata of paying gravel was struck, which prospected from three to twenty feet. It was found at a depth of 18 feet from the surface. Higher up the eminence, Mr. Reed, in sinking a well, found from three to twelve cents to the pan. We concluded from this that the town was liable to be undermined, and immediately could be seen notices on every corner, tree and dwelling, claiming said lots, tracts or building ground for mining purposes. It fully settles the question, Will the hills pay? The largest lump yet, was taken out last week on Rhodes' creek: It is entirely free from quartz, and weighs \$140. It came out of Mr. Collins' claim.

ON THE INFLUENCE OF EXTREME COLD ON SEEDS.—Some experiments, more thorough and satisfactory than those of Edwards and Colin, have been made during the present year by Prof. Elie Wartmann, of Geneva, on the influence of extreme cold upon the seeds of plants. Nine varieties of seeds, some of them tropical, were selected. They were placed in hermetically sealed tubes, and submitted to a cold as severe as science can produce. Some remained fifteen days in a mixture of snow and salt; some were plunged into a bath of snow and sulphuric acid. On the fifth of April, they were all sown in pots placed in the open air. They all germinated, and those which had undergone the rigors of frigidly produced plants as robust as those which had not been submitted to this test.

ORGANIZATION OF THE NEVADA TERRITORY LEGISLATURE.—The Nevada Legislature, organized October 1st, without trouble. The President of the Council is J. L. Van Bokkelen, of Virginia City, who said in his speech, he trusted they would take measures to crush out the damnable heresy of secession. [Applause.] The secretary is Rev. Henry Smeathman, of Virginia City, late of Marysville, assistant secretary, G. J. Lansing; Sergeant-at-arms, N. T. Carpenter; messenger, Phillip E. Shannon; page, Henry Lewis; Speaker of the House, M. N. Mitchell, of Virginia City; clerk, Wm. Martin Gillespie, of Carson; assistant, Samuel E. Wetherell, of Virginia City; Sergeant at arms, J. B. McCormick of Carson; messenger, G. S. Pearson of Carson. All are Union men; special politics unknown.

NEW VEGETABLE GUM.—A committee of the Society of Arts in London has recently reported on the new gum *pauchonta*, the product of a tree similar to that which produces gutta-percha. This gum is hard and friable at ordinary temperatures, but by the application of heat it becomes pasty and viscous, and when once it is in this state it does not return to its original condition. When boiled in water, it assumes a reddish-brown color, and makes the water a little soapy. Many reagents act upon it precisely as they do upon gutta-percha. The new gum cannot take the place of gutta-percha, but from twenty to thirty per cent. of it can be mixed with gutta-percha without sensibly changing its properties.

NEW COPPER MINES.—A correspondent of the *Bee* writes, saying it is just back of and near Crescent city that the new copper mines have been discovered. The Alta Company sent forty-three tons of their ore to Boston, which paid them one hundred and seventy-two dollars seventy-five cents to the ton. This is from the outcroppings, and from near the surface. From the Excelsior lead, on Kidney Copper Mountain, the Myrtle Creek boys have ready for shipment several hundred tons. All along the Bald Hill country extensive outcroppings of very pure copper ore are found, running northerly and southerly in connection for forty miles; and traces of copper ore are found for some sixty miles in extent along the coast, back from twelve to twenty-five miles. This country has, as yet been very little prospected, and the leads have not been developed or even claimed, as no particular excitement prevails here. A very rich vein of gold-bearing quartz has recently been discovered on the Bald Hills, about twelve miles from Crescent City. It is large, rich, and well defined, and right in the town a coal lead has been discovered, but not of sufficient size to pay working. Col. Sherman Stevens, of railroad notoriety, is now vigorously opening up the dry placer diggings of rich gold, by cutting a ditch from one of the branches of Smith's river to the French Bald Hills at a cost of \$30,000.

By the premature explosion of a blast at the Eureka Mills in Sierra County, a man named Pierce had his collar-bone fractured and a compound fracture of the left arm near the shoulder. The injury is a very serious one.

STILL ANOTHER ACCIDENT.—A man named John Richards was seriously injured lately, while at work in a mining claim at Jones' Bar, Nevada county, by a tub of dirt falling upon him. His right arm was broken and the elbow dislocated, and his left leg badly cut.

New Process of Amalgamation.

Take any of the known amalgamating rotating pans, put in fifty pounds of fine pulverized rich silver ore, and sixty pounds of quicksilver, two pounds of caustic potash, half a pound of Sal Ammonia, sufficient water to bring the ore into a thick muddy emulsion; let it grind five hours then dilute with more water draw it off. Very many of the reputed new processes employ these ingredients, but is in reality nothing new.

The proprietor of this journal has now a new machine in course of progress for which he is taking out a patent which will work the ore to its standard value. This is saying much, but this we will be able to demonstrate to those who are interested, if they will call at our office and examine our arrangements.

EARTHQUAKE IN NEW ENGLAND AND CANADA.—One of the most severe shocks of an earthquake experienced for many years in the northern portions of the United States, and in Canada, occurred on the morning of October 17, 1860. In the northern part of Vermont the motion was sufficient to jar open fastened doors, ring the church bells, and in one case, at Northfield, Vt., a church spire was thrown out of position by the force of the shock, and in another, at Brattleboro', a house was cracked in two. In the vicinity of Quebec, the shock was also sufficiently powerful to occasion much alarm and produce some injury

Crushing and Dressing Machinery.

Metallic ores are usually concentrated by the agency of water, in accordance with the following laws:

If bodies of various sizes, forms and densities, be let fall into a liquid in a state of rest, it is evident that the amount of resistance which they experience will be very unequal, and they will consequently not arrive at the bottom at the same time. This necessarily produces a sort of classification of the fragments, which becomes apparent on examining the order in which they have been deposited.

If it be supposed that the substance have similar forms and dimensions, and differ from each other in density only, and it is known that the resistance which a body will experience in moving through a liquid medium depends solely on its form and extent of surfaces, and not on its specific gravity, it follows that all substances will lose, under similar circumstances, an equal amount of moving force.

This loss is, however, most sensible in substances possessing this power of movement in a less degree: or, in other words, it will be proportionally greater in light bodies than in those having a more considerable density. The former for this reason, fall through the liquid with less rapidity than the denser fragments, and must therefore arrive later at the bottom; so that the deposit will be constituted of different strata, arranged in direct relation to their various densities, the heaviest being at the bottom and the lightest at the top of the series.

Supposing, on the contrary, that all the bodies which fall through the liquid possess similar forms and equal specific gravities, and that they only differ from each other in point of volume; it is evident that the rapidity of motion will be in proportion to their sizes, and the larger fragments will be deposited at the bottom of the vessel.

As we have supposed them on stating to have the same forms and densities, it follows that the resistance they experience while descending through the water will be in proportion to the surface opposed; and as the volumes of bodies vary according to the cubes of their corresponding dimensions, whilst the surfaces only vary in accordance with the squares of the same measurements, it follows that the force of movement animating them is regulated by their cubes, whilst their resistance is in proportion to their squares.

If, lastly, we imagine that all the fragments have the same volume and density, but are of various forms; it follows that those which possess the largest amount of surface will arrive at the bottom last, and consequently the upper part of the deposit will consist of the thinnest fragments.

It is evidently, then, of the greatest importance that the grains of ore which are concentrated by washing should be as nearly as possible of the same size, as otherwise the smaller surface of one fragment, in proportion to its weight, will in a measure compensate for the greater density of another, and thus cause it to assume a position in the series to which by its constitution it is not entitled. This difficulty is constantly found to occur in practice; and in order, as much as possible, to obviate it, care is taken to separate, by use of sieves, into distinct parcels, the fragments which have nearly the same size. Although, however, the grains of ore may by this means be, to a certain extent, classified according to their respective dimensions, it is impossible by any mechanical contrivance to regulate their forms, which must greatly depend on the natural cleavages of the substances operated on, and therefore this circumstance must always to some degree affect the results obtained.

Each of the broken fragments of ore must necessarily belong to one of the three following classes;

The first consists of those which are composed of the mineral sought, without any admixture of earthy matter. The second will comprehend the fragments which are made up of a mixture of mineral ore and earthy matters; whilst the third division may be entirely composed of earthy gangue, without any admixture of metallic ore. By a successful washing these three classes should be separated from each other. The first will form the lowest stratum, and the mixed fragments follow next in succession, whilst the unproductive portion is deposited upon the two other layers.

CRUSHING MILLS.—Among the various modern improvements introduced into mining is the crushing mill. This machine, which has been brought to a great degree of excellence is become of much value for the treatment of many varieties of ore, and is more especially adapted for mines yielding large quantities of dredgy or disseminated mineral.

This apparatus is exceedingly simple in its construction. The power necessary to give it motion may be taken either from a steam-engine or water-wheel, and be communicated by connecting the shaft of one of the rolls directly with the axle or by intermediate spur gearing.

It has been sometimes found advantageous to make the roller placed on the driving shaft somewhat longer than that which is opposite. The width of the rollers of a mill in which their diameter is twenty seven, should be about sixteen and fourteen inches respectively.

It is found in practice that rolls have a tendency to wear hollow in the centre; this, after a while, allows the stuff to fall through without being properly crushed. The only way in which this inconvenience can be partially remedied, is to keep the feed as much as possible towards the ends of the rollers. For very fine grinding the crusher is inferior to horizontal or edge mills; but it may be used advantageously where the crushed stuff will have to pass through a mesh of from twelve to fifteen holes to the linear inch; beyond this

point it is found that simple pressure may be advantageously replaced by frictional force. The circular sifter beneath a mill is sometimes replaced by a perforated periphery on the raff wheel; this method does not however admit of ready alteration when different degrees of fineness are necessary.

It is desirable that rolls should be as hard as possible, hence it has been attempted to case harden them by chilling. Practice has, however, shown that, although the crushing faces are thus rendered harder, the advantage is nullified by the brittleness thereby imparted. Ordinary sand cast rolls are therefore most frequently employed.

Variable speeds have been tried in order to produce friction, together with pressure at the line of contact, but it has been found that any departure from a uniform speed in the two surfaces, absorbs a considerable additional amount of power without materially augmenting the results. Rollers worked by friction furnish less economical results than those driven by spur gearing.

EDGE AND HORIZONTAL MILLS.—For the purposes of fine crushing, and more especially for reducing ores to a totally impalpable condition, it is necessary that the apparatus used should keep the matter to be ground, during a considerable length of time, under a frictional and compressive influence, and for this purpose two different arrangements, the edge and horizontal mill are employed.

The principle of the former may be described as consisting of an arrangement in which two circular runners are made to traverse the outer circumference of a flat or slightly conical basin.

These mills are chiefly used to effect the reduction of silve and auriferous ore. In the case of horizontal mills, the mineral is first reduced to a small size, and subsequently introduced between stones in the same way that corn is passed into a flour mill. In the edge mill the ores are thrown into a basin and kept under the runners by means of an iron scraper. After being subjected a sufficient length of time to the action of the runners they are removed and a fresh charge is introduced.

In practice the horizontal is much more effective than the edge mill: in the latter simple compression is the chief grinding force employed, whilst the rubbing action is comparatively small.

The amount of frictional area available in the edge mill is directly proportionate to the difference of distance traveled over by the inner and outer edges of the runners.

Practically the amount of fine-ground material produced by each description of mill is in direct relation with the amount of frictional surface furnished.

The chief advantage of the edge mill is its simplicity of construction, and consequent small first cost; but all its parts require to be made of great strength, and therefore of proportionate weight; hence this apparatus becomes objectionable for countries where transit of heavy machinery is more than ordinarily expensive.

Any advantage this mill may appear to possess is, however more than exceeded by the cost of grinding.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mine:alogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

A BOOK FOR THE MINES.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide," a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work. It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

THE MINER'S COMPANION AND GUIDE.—In a recent notice of this invaluable work, we omitted to give some of its leading features of interest and value specially designed for our mining community and metallurgists. This book has been carefully prepared and published by the enterprising editor of the "Mining and Scientific Press," of San Francisco. It contains nearly one hundred fine illustrations, with three hundred pages of interesting and instructive matter, forming a neat little volume substantially bound, at the low price of two dollars. It is thus far the best mining work issued on this coast, having complete treatise on veins and lodes, timbering of mines, manual of metallurgy, the geology of California, and the most important of all, many new and interesting methods for separating gold and silver ores, and pyrites together with a glossary of technical terms not contained in any other work. The miners of this coast will find this an indispensable hand-book. Every Californian should possess it.—[Sac. Bee.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins, and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alt. California.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press," of San Francisco. The title of the work is the Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compendium of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and usefulness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's rugged soil its hidden treasures.—[Union Temperance Journal.

Book Dealers and others will please send orders through mail or express to the office of this Journal.—Liberal percentage allowed.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smut-ter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plate or runner of each set is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the Smut Balls, Oats, Chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals,—whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machinery, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and that he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off in to a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. S. LVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc. The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing.

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000
IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.
The Books of Subscription are open at the office of Pioche & Bayerque where the required first instalment of 10 per cent will be received.
F. L. A. PIOCHE, President.
J. H. APPLIGATE, Secretary.

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

BEST FOR FINE SEWING,

BUT THE BEST FOR...

MANUFACTURING CLOTHING

AND...

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the blading of Blankets, making Flannel Shirts, Cassimere and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them can not be surpassed.

Various styles of Machines have been employed on the above materials but the Wheeler & Wilson is preferred.

DONALD MCLENNAN,

Proprietor of the Mission Woolen Mills.

A. ROMAN & CO.

Booksellers, Importers, Publishers,

507 MONTGOMERY STREET,

SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 280 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc., Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Rudimentary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lam-born.

The Discovery and Geognosy of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Disquisition on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

Send your orders to

A. ROMAN & CO.,

507 Montgomery Street, San Francisco.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supersede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silver-smith, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.
Yours, truly,
G. W. HARRIS, E. BALDWIN,
M. CROGER, CHARLES McCANNON,
D. R. MEACHAM.

MR. STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harnett's field, and I am pleased with its performance. The cam wheel power over that of the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging-bearings and boxing, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.
Yours, with much esteem,

ELAM BROWN,
PACIFIC, June 28, 1860.
MR. STANDISH—Sir: This is to certify that I have operated one of your Mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the knife is easier than a cog wheel machine, and also that it will not clog in the knife in clover, or eat any grass.
Witness: Washington A. Wilson, W. T. Hendrick.
G. F. BROWN.
LAFAYETTE, June 27th, 1860.

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. Further particulars at the office of the Press. ap10

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2d. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, grate bottom, upon which the grinding is done, and which allows the gold as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

J. B. BEERS
No 15 165 Clay street.

LEWIS COFFEY & RISDON'S

STEAM BOILER AND SHEET IRON WORKS

The only exclusively Boiler Making Establishment on the Pacific Coast Owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted in quality.

Old Stand, corner of Bush and Market Streets.
Opposite Oriental Hotel, San Francisco, Cal.

LEWIS COFFEY, J. N. RISDON

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....OCT. 12 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sanson Sts., by

J. SILVERSMITH, Editor and Proprietor.

At Fifty Cents per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plaques or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C. is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the Press will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, so as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

Mineral Wealth of the Pacific States.

The entire press in this State and along the coast from Mexico to the British possessions teem with glowing accounts of rich discoveries of precious metals and other minerals. It is admitted, says a contemporary, that California, beyond a question, possesses mines of a richness and extent equaled by any other country in the world, but it is not generally well known, or understood that she also possesses mines of what are termed the baser metals, such as iron, lead, copper, etc., as well as coal, lime, alum, borax and soda, substances equally important and valuable. The sole energy and purpose of the laboring classes, as well as the capitalists among her population has been almost exclusively devoted, and are still, to the discovering and development of the mines of gold and silver, and owing to the lavishness with which nature has distributed these metals through the length and breadth of her territory, ample scope is found for the exercise of their skill, industry and vitality; but were the means of increasing the laboring masses of her population not left almost entirely in the hands of rich and powerful monopolies, whose exorbitant rates of passage virtually exclude the poor laboring classes from coming here, many of the most valuable of her vast mineral resources would not remain long undeveloped. There are many localities in this State which appear sterile and repossessing to the eye of the unskilled prospector, the

sole object of whose search is gold or silver, which at some future day will prove vastly more valuable to their proprietors than either gold or silver diggings.

There is a county in England (Warwickshire) the product of whose mines and manufactories are found in every portion of the globe, is to appearance, the most unpromising sterile-looking portion of British dominions; it is the mines of iron, lime and coal in that country, which have made it the chief manufacturing country, as far as metals are concerned, in the world, and there can be no doubt, that when mining operations in this State shall be conducted on scientific principles, to a greater extent than they are at present, aided by capital, the vast tracts of mineral land, which at present are considered absolutely worthless will be found of incalculable value. It is true that, considering the recentness of her formation as a State, and the nature of a great portion of her population, California has made great progress, and without indulging in any Utopian fancies, we see no cause to doubt that before the expiration of the next ten years, that she will be in a position to furnish the market of the world with many other metals and minerals besides gold and silver. Neither Pennsylvania or Ohio have gold or silver mines, yet the annual products of the coal mines of the gold mines of the former is supposed to amount to one hundred and thirty-five millions of dollars, while the products of her iron mines are nearly equally valuable. The products of Ohio are nearly as much in dollars and cents as those of Pennsylvania. It is well known that the mines in those States were suffered to lay idle and undeveloped for a number of years after their discovery, before the people fully awakened to their value and importance. It is just so with California—we must wait till the people awaken to the importance and value of other substances than gold and silver ere we can expect to witness the development of a tithe of her resources.

Several years ago within a few miles of Auburn, iron in an almost pure state was discovered, and the surrounding country bears unmistakable evidence upon its face of an iron region. Over near Pilot Hill, within twenty miles of Forest Hill, a vein of cinnabar was discovered more than a year ago, but these sources of wealth are allowed to remain undeveloped, and doubtless will continue to remain so for years.

Mining Machinery for Mexico.

Peter Donahue Esq., of the Union Foundry, recently shipped, per steamer to Mexico, \$11,000 dollars worth of new machinery, comprising engines, batteries, amalgamators, etc. Most of our machine works and foundries are busily at work on like implements, destined principally for Washoe, Esmeralda and other important mining regions. At the Pacific Foundry quite a rush for Bryan's mills prevailed. The Vulcan Foundry have also been driven for boilers and new machinery. Though a general stagnation in commercial matters exist, yet no abatement in home productions seems manifest. Merchandizing has woefully fallen since a few years, and our markets are no longer glutted. Artisans and mechanics are in demand. The interests of home producers is looking up—as it should.

To our Esteemed Mountain Contemporaries.

We are again driven to the wall for want of mining news this week. Cannot our compeers in mountain towns obtain sufficient interesting matter pertaining to mining operations in their vicinity? The "Mountain Messenger," at La Porte, has again turned up in our sanctum; like "Phœnix" it rose from its ashes looking as saucy and piquant as ever—heretofore replete with mining news, but now alas! not even the "color" is mentioned. We assure our mountain Journalists that they can bring no better news than that pertaining to its immense mineral wealth. This will attract an emmigration to our shores, which will do more to develop the resources of the Pacific States than any other subject.

Ungrateful.

Nearly the entire badge of interior journals of this State have copied from us—the MINING AND SCIENTIFIC PRESS—our item, *Rates of Ocean Passage*, without giving us an acknowledgement therefor. Come brothers, make the *amende honorable*, or we shall hold you to an account for pilfering.

Valuable Invention.

Mr Mitchel, of this city, has exhibited to us a very ingenious contrivance for coupling hose for fire engine suction, and similar purposes. A deal of time must be saved with this application; it is remarkably simple and works to a charm. We shall no doubt file an application for Letters Patent through the agency of this journal.

A Chance for Inventors.

There can be no question that enormous sums are annually lost to the miner from the want of some improved scientific method of treating the "tailings"—that is, the dirty water, sand and soil from the different claims adjoining a flume. The editor of the Columbia Times has been at the trouble to find out, as nearly as possible, what is gained by the various fluming companies who wash the tailings which flow through the main gulch in his district. He finds that the "wastage," after being as carefully washed as the miners consider possible, is "led through long strings of sluices into the main flume, which is above a mile in length. This flume—when it was in good order, and before the company commenced lowering its grade, which has involved an outlay of some \$40,000—used to pay between three and four percent. per month, on a capital stock of \$40,000, over and above all its working expenses, and when it shall be completed at the new grade we believe it will pay even better.

"After the tailings have floated through this mile of flume, and as much of the gold as possible has been extracted, the 'tailings' pass into the North American Company's Flume, about one-fourth of a mile in length. Here again large quantities of gold are extracted, after which, they pass into the flume of Wayde & Co., who have about 200 feet of fluming, out of which they manage to obtain six or eight dollars per day to each member of the company. The tailings then pass into the flume of Potter & Haynes, about 700 feet in length. One share—one sixth—in this flume was recently sold for \$600. Below this, John Mitchel has 1500 feet of fluming, and Duncan & Co. 1200 feet, both of whom are making money by washing the dirt after it has passed through all the others, and others would work below them, and do well too, but there is no fall for the water. All this we advance as a proof that any ingenious mechanic who could devise a method of saving the finer particles of gold, as soon as they are liberated from the soil, before the water flats them off, will, in making his own fortune, greatly aid thousands of others in making theirs."—Mirror.

American Fossil Floras.

At the meeting of the American Association, 1860, Dr. Newberry gave a sketch of the succession of different floras on the North American continent, remarking that the Devonian and Carboniferous floras had been carefully studied and characterized by the prevalence of cryptogamous plants, as ferns, etc., and that the floras of America during these ages were strikingly like those of Europe of the same epoch. The Permian flora was scarcely known in this country; it was but a continuation of the Carboniferous. He observed that the Triassic and Jurassic floras were characterized by the prevalence of numerous and beautiful Cycadaceous plants which had been studied and beautifully illustrated by European fossil botanists, but had hitherto been very little known in this country. Recently he had procured a large number of fossil plants of this age from New Mexico and elsewhere, which had shown that, as in Europe, the flora of America, during the period of deposition of the New Red Sandstone, was cycadaceous in character and similar to that of Europe. At the commencement of the cretaceous era, however, the flora of the continent was revolutionized, and apparently suddenly, though doubtless gradually. The broad-leaved dicotyledonous plants were introduced, and the vegetation of the continent assumed the general aspect which it has at the present day. Among the cretaceous plants are found species of *Liriodendron* (tulip-tree), *Liquidamber* (sweet-gum), *Sassafras*, etc., etc.—genera now living in our forests, of which the first two existed on the continent of Europe during the tertiary ages, but are not now known there. Dr. Newberry concluded by saying that the aspects of nature, as far as vegetation is concerned, on our continent, are of an antique type, and that the plants, as was the case with many of the fishes, were old-fashioned forms. The climate of the United States, as indicated by these plants, had been, through the cretaceous epoch, temperate, and much as now; but during the tertiary it had been slightly warmer than at present, but still temperate, and cooler than the climate of Europe at the same epoch.

CAVE.—A cave has been discovered in the range of mountains east of Carson river, and but a few miles from the coal regions, that is quite a curiosity. It has a large mouth or opening, facing to the west; the chamber is about thirty feet in diameter, and eighteen feet high. The roof is ornamented by stalactites, and the floor covered with petrifications of vegetable and animal nature. The cave seems to be situated in an extensive limestone formation, and must have been the resort of animals from time immemorial. A party prospecting for coal were the discoverers. They say that the appearance of the cave when lighted up is gorgeous.—Mirror.

To Miners and Mill Owners,

CALIFORNIA.

NEVADA TERRITORY.

WASHINGTON TERRITORY.

AUSTRALIA.

LOWER CALIFORNIA.

BRITISH COLUMBIA.

The Otter arrived, bringing about one hundred thousand dollars—the principal portion being in private hands—and forty-five passengers, twenty-two of whom were Chinamen. Two men named Patterson brought down ten thousand dollars each, two large nuggets came down, one weighing twenty-two ounces and the largest piece that has yet been taken out, the size of a nut, from the neighboring colony. The population in the Cariboo, according to the most recent accounts, amounted to about 1,500, three-fourths of whom are at work.

Are the Coal-measures a Single, Unique Formation?

Are the coal-measures a single, unique formation? Do they belong to a single epoch, or are they composed of a succession of formations, separated by immense spaces of time, and of which the different stages might be compared to those of the recent formations: the Eocene, the Miocene, and the Pliocene, for example? In the last case, can we admit the vegetation of which the remains have been preserved in the shales of the coal, or the vegetation of the coal-marshes, as a true representative of the flora of the various epochs where the coal was formed? Or was it then, as the bog-vegetation is in our time, composed of a peculiar group of plants, adapted to the formation of the coal, pertaining to the marshes only, while another flora, of a different character, was covering the dry land, if there was any dry land, at the carboniferous epoch?

From the thickness of some beds of coal, representing a mass of combustible matter as great at least as that which is contained in our oldest and deepest peat-bogs, from the thickness and various composition of the strata which separate the beds of coal, and from the successive changes in the vegetation of the coal, it appears that the last alternative is admissible. Different hypotheses have been put forward to explain the so-called huge or gigantic vegetation of the coal formations. But there is nothing in the carboniferous epoch authorizing the supposition that the power of vegetable life was greater than it is at our time. The combustible matter heaped in some of our peat bogs is sometimes sufficiently thick to be equivalent to the coat of a bed of four to five feet. The trees growing in our marshes or on the peat bogs are generally larger than those which have been preserved in the strata of the carboniferous measures. The Dismal Swamp is impenetrable on account of the great compactness of its vegetation. It is not an easy matter either to get across the heaped, half prostrated, or erect and closely pressed trees of our cedar-swamps of the North. If such marshes were extended over the greatest part of the United States, they would present a fair representation of those of the carboniferous period.

The occasional appearance of the petrified trees, standing imbedded in sandstone, does not give evidence of a rapid formation either of the coal or of the other strata. Local disturbances may throw a few feet of sand upon a marsh, covered with active vegetation, and thus preserve the stumps from decomposition, and by-and-by these may be converted to stone. The bald cypress and other species of trees grow sometimes in the marshes near the sea-shore under ten feet of water. Whole forests of those trees have been imbedded in a standing position in the marshes around New Orleans. Thus I do not find in the geological records of the carboniferous period any indication of a rapid process of formation, either cataclysmic or abnormal, and I readily admit that each bed of coal, with its accompanying strata of fire-clay and shales, has required for its formation a period of time as long as any of our recent geological divisions.

The question concerning the existence or non-existence of dry land covered with a peculiar vegetation at the epoch of the coal formation, cannot be answered positively or negatively by sufficient evidence. The only fact that would indicate that the marshes of the carboniferous epoch were surrounded by land bearing plants of different kinds than those living on the bogs is the presence in coal and in sandstone underlying it of a great number of fruits of different species which by their nature have no relation to any of the other remains preserved in the coal. They have been generally referred to species of *Chrdaites*. But the two only species of our coal measures are found in abundance at geological horizons where the fruits are entirely absent. And even coal shales appearing entirely composed of heaped remains of leaves of *Cordaites borassifolia* do not contain any fruit. The species of fruit, *Carpolithes Cordai* Gein., referred by M. Geinitz to *Cordaites borassifolia*, our most common and omnipresent species, has not been found in the coal measures of America. Therefore, either the fruits of unknown relation belong to vegetable species which have grown on the marshes, and of which the remains, leaves and stems, have been entirely obliterated, or those fruits belong to species growing out of the marshes, around them, and have been floated, and thus disseminated in the shales and in the sandstones. This last opinion appears at first confirmed by a similar process of distribution of species in our deep swamps; as the hollow trunks of the bald cypress which grows in Drummond lake (Dismal Swamp of Virginia) are filled by fruits, acorns, nuts, etc., of trees which grow on the dry land near its borders. But it is not presumable that species of fruits only could have been floated and disseminated by the agency of water, without any of the branches and of the leaves of the plants to which they belong. And nowhere have the shales, covering what is called the tail of a coal bank, viz. the part butting against a hill of sand or losing itself in sandstone, exposed any remains of plants of another type than those belonging to the true coal formation. Even where the shales of the coal are covered with remains of shells and of fishes, and consequently formed when the marshes were immersed, all the floated remains of plants which are found with those of animals belong to the common species of the coal. I believe, then, that the plants preserved in the shales of the coal give us a fair representation of the general flora of the carboniferous epoch, as true and as general at least as the fossil plants of the Miocene represent the general flora of the tertiary period. And I suppose that if there was any dry land around the

marshes, the vegetation contained only a few species different from those living on the marshes. But this last opinion is merely hypothetical.

Coal.

Imports from January 1st to September 15:			
Anthracite, tons	16,903	Sydney, tons	11,304
Cumberland cks.	1,144	Japanese tons	25
English, tons	14,165	Vancouver I. tons	4,536
Chili, tons	9,135	Coast, tons	11,384

The sales of 3000 tons Anthracite, to arrive, which occurred some little time since, and were not made public, are the only transactions of moment which have come to our knowledge. They were effected at \$18 @ 19 per ton, with some slight resales at \$20. Our quotations give a true index of the market.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For parting silver from gold when gold

is below 300-1000ths. fine	3cts per oz.
" from 300-1000ths. to 750-1000ths fine	7cts "
" " 750-1000ths to 950-1000ths "	14cts "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce ½ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, ½ per ct. gross value of silver for making bars; also when gold is contained ½ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. ½ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. ½ per ct. gross value for coining, when gold is contained, refining charge the same in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. ½ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule hereafter be, that the value of gold contained in the bullion will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at per standard oz., and is exempted from the coinage unless deposited for silver dollars, in which case a charge of ½ per cent. will be made additional. Bullion of the denomination will be entered on the gold and silver receipts as most congruous with the physical aspects of the metal, but in the warrant it must be marked that so much is paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and regulations were promulgated on July 10th, by Superintendent J. Stevens.

RATES OF OCEAN PASSAGE.—The prices of passage steamers of the P. M. S. S. Co., through to New York are as follows: First cabin, deck room \$258 50, main room, \$233 25; second cabin \$180 75; and steerage 25. To go to New York around Cape Horn in a ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage China costs from seventy-five to one hundred and fifty dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

Established in 1854, for the Permanent Cure of all Private and Chronic Dis- eases, and for the suppression of Quackery.

Consulting and Resident Physician—**L. J. CZAPKAY, M. D.,**
In the Hungarian Revolutionary War, Chief Physician to the 20th Regiment of Honvéd. Chief Surgeon to the Military Hospital at Pesth, Hungary, Late Lecturer on Diseases of Genito-Urinary Or- gans, and Diseases of Women and Children, and Honorary Member of the Philadelphia College of Medicine.

Particular attention paid to the treatment of Diseases peculiar to Wo- men and Children.

OFFICE HOURS—From 9 A. M. to 10 P. M.
Communications strictly confidential. Permanent cure guaranteed or Consultations (by letter or otherwise) free. Address,**Dr. L. J. CZAPKAY, San Francisco.****Spermatorrhœa.**Local weakness, nervous debility, low spirits, lassitude, weakness of the back, indisposition and incapability to labor and study, dullness of vision, loss of memory, aversion to society, love of solitude, timidity, distrust, dizziness, headache, pains in the side, affections of the eye, pim- ple on the face, sexual or other infirmities in man, are cured by the justly celebrated physician and surgeon, **Dr. L. J. Czapkay.** His method of curing is new, (unknown to others,) and hence the great success. All con- sultations, by letter or otherwise, free. Address,**Dr. L. J. CZAPKAY, San Francisco, Cal.****PACIFIC FOUNDRY AND MACHINE SHOP,** First Street, between Mission and Howard, San Francisco, California.—By recent additions to our be- fore extensive establishment, we can confidently announce to the public that we now have **The Best Foundry and Machine Shop on the Pacific Coast.**

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months; Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sub, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanc- com's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Frames; Horse Powers; Smit Mills; Roller Frames; Wind Mills, of Hunt's, Johnson's and Lam's Pat- ent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO**ADVANTAGES**

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight

of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set-at work Crushing the Ore, in Ten Hour after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS
Of all sizes, furnished with dispatch.

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Dura- bility, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to un- even surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstruction, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with- out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchas- ing.

Correspondences of the American and European Coal-flora.

Considering its generic distribution, the American coal-flora is nearly related to the European. We have only two or three peculiar genera, representing distinct types, which have not been seen in Europe. On the contrary, Europe has no true and generic types of coal plants which are not represented in the coal-fields of the United States.

Considering its species, a more marked difference in the coal-flora of both continents becomes evident. Some of our species represent marked and peculiar forms or types, which are not seen in Europe, though a much greater number of species has been found in its coal measures. Thus the predominance of typical or distinctly characterized forms belongs to our country. By comparison of the flora of our epoch on both continents, we find now the same proportional relation and difference as at the time of the coal formation, that is, on this side of the Atlantic predominance of well marked types; a predominance of species of trees; a number of species perfectly identical on both continents, and many American species so nearly related to European congeners that their specific characters can hardly be established.

Though further researches might necessarily increase the number of species of fossil plants belonging to our coal measures, the proportional difference is likely to remain as it is established above.

The fossil flora appears identical at the same geological horizon over the whole extent of our coal-fields. This proves uniformity of stratification and geological unity of the different coal basins of America.

The first trace of vegetable terrestrial life appears in the middle of the Devonian in a species of *Lepidodendron*, represented by its bark, its leaves, its cones, and large trunks of silicified wood. No remains of any other form of terrestrial vegetation have been seen in strata either inferior or contemporaneous to this. All the vegetable remains known in the Silurian and lower Devonian belong to species of *Fucoides* or marine plants, mostly of small size, resembling some species of *Fucus* of our time. The first leafy terrestrial plants appear in the Old Red sandstone. All the representatives of this new vegetation belong to a peculiar genus, *Neggerathia* Gopp., more related to Conifers or even to Palms than to Ferns. They are found in the same geological horizon, both in Europe and in America, and entirely disappear at or before the beginning of the coal epoch.

On the Fossils of Dura Den, Scotland.

Dura Den is a small valley in the northeastern district of Fifeshire, Scotland, which has long been classic ground with British geologists, both on account of the lithological character of the Devonian sandstones there developed, and the number of fossils remains found in them. These last belong almost exclusively to that class of ganoid heterocerat fishes, the presence of which is so distinguishing a characteristic of the Devonian epoch.

The following extract from a monograph of the fossils of Dura Den, by the Rev. John Anderson of Scotland, published during the past year, will convey some idea both of the number and of the extraordinary state of preservation in which the fossils of this deposit are not unfrequently found:—"The remains of these fishes are so very abundant in the yellow sandstone deposit of Dura Den, that a space of little more than three square yards, when the writer was present, yielded about a thousand fishes, most of them perfect in their outline, the scales and fins quite entire, and the forms of the creatures often starting freely out of their hard stony matrix. In their complete armature of scale, fin, and bone. This peculiarity of entireness, and even of freshness, in these olden denizens of the waters, is so remarkable, that, when first exposed to view in the newly split-up rock, there is a lifelike glistening over the clear, shining, scaly forms, so that one can scarcely divest himself of the idea that, instead of the innumerable series of geologic terms to be counted, he is looking actually upon the creations of yesterday, the relics of things that had just ceased to breathe. 'Here is a living one!' exclaimed a workman, as he raised from the bed of a river a large flagstone, in which were counted upwards of fifty fishes, one preeminently full, beautiful and rounded in its form. Indeed, the most splendid representations of an Audubon, a Gould, or a Landseer, on their glossy canvas, will shrink in comparison beside these pictures of nature-painting, brighter than the dyes of the artist, as set in their stony tablets, and contrasting finely with the rich saffron-colored rock, in which, uninjured and unstained, they have hung for ages."

MINERAL DEPOSITS.—The *Territorial Enterprise* says that a quartz mill at Gold Hill, Nevada Territory, has been stopped by reason of a solid encrustation which has been deposited on the inside of the boilers and tubes of the steam engine which furnishes the motive power. The boilers are so clogged and choked that new ones will have to replace them.—The deposit is of a porcelain character, and is common in steam boilers all over the territory.

A discussion which has recently taken place in the French Academy of Medicine, on the action of iron used as a medicine, has made known this unexpected fact, that there physicians who deny any influence exercised by medicines in virtue of their chemical properties, who think that the physical and chemical actions of the animal economy differ entirely from those which are observed in the vegetable kingdom.

University of the Pacific

We give below, from the Announcement of the change in the departments of our University, deeming it a matter of intelligent remuneration to all. This institution asserts by announcement that the fourth regular course of lectures in this institution will commence on the first Monday in November, and be continued for eighteen weeks.

It will be observed that since the last annual appointment was issued, several important changes in the Faculty have taken place.

Dr L D Lane, late of the Medical Corps, of the United States Navy, has been appointed by the Board of Trustees to fill the vacancy in the Chair of Physiology occasioned by the resignation of Professor Cole; and Dr Henry Gibbons, formerly Professor of Theory and Practice in the Philadelphia College of medicine, has been appointed to the Chair of Materia Medica, made vacant by the resignation of Prof. Carman, who through ill health has been compelled to remove his residence to Mazatlan in Mexico.

The following are the faculty with proper address:

J Morrison, M D, Professor of Pathology and of the principles and practice of medicine.

Isaac Rowell, M D, Prof. of chemistry.

R Beverly Cole, M D, Professor of obstetrics and of the diseases of women and children.

E S Cooper, M D, Professor of Anatomy and Surgery.

Henry Gibbons, M D, Prof. of materia-medica.

L C Laae, M D, Professor of Physiology.

Hoa George Barstow, Professor of medical jurisprudence.

R Beverly Cole, M D, Deaa, 1121 Stockton street, near Pacific.

The Clearing of Drains and Water Courses.

Messrs. Easton & Amos, of Len Inn, have patented a curious method of adapting to some convenient part of a drain, sewer, or water course, a grating of peculiar construction, whereby any extraneous solid matters, such as weeds, pieces of wood, brickbats, stones, the dead bodies of animals, or other substances, may be arrested in their progress, and removed, so as to prevent them from blocking up the water-course and stopping the flow of the water. To this end a chamber or recess is constructed at some convenient part of the drain, sewer, or water course, and made to extend across it from side to side. In this chamber is mounted a movable grating in such a manner as to extend transversely across the whole of the water-way. The grating is to be formed of a suitable number of endless chains, connected together laterally in any convenient manner, and provided with projecting pins, points, or hooks. Or a number of short bars, similarly provided with projecting pins may be jointed together in an endless series, so as to form an endless grating, which is to be passed round wheels or rollers mounted in the chamber or recess. This endless chain or grating should not be placed vertically, but at an inclination in the line of the drain or sewer. It will be understood that the water and liquid matter will pass freely through the endless chain or grating, but that solid matters of any great size or dimensions, or that would be likely to cause an obstruction in the water-course, will be arrested by the grating, and by causing the same to rotate (by communicating motion to the wheels or rollers on which the endless chain or grating is mounted) the pins, points, or hooks attached to the grating will be caused to lift up such solid matters out of the chamber formed in the drain, and deposit them in some receptacle provided above for that purpose.

Water obtained from the Soda Springs on the new Sacramento road to Yreka, above Red Bluff, makes a pleasant effervescent drink after being bottled.

Complimentary Notices.

The following are additional complimentary notices of the "Miner's Companion and Guide,"—the first by the *Mirror*, the latter by the *Spirit of the Times*, both of this city, for which we tender our thanks:

Mining Statistics of California.—"The Miner's Companion & Guide," a compendium of valuable information for Prospector, Miner, Geologist, Mineralogist and Assayer. 1 vol., pp. 229. San Francisco. J. Silversmith. This interesting and valuable compilation, a copy of which was placed on our table some days ago, is just the thing for the miner, and for those whose interest are involved in that fascinating pursuit—fascinating in spite of the toil and drudgery which are its inevitable conditions, and the uncertainty which now elevates, now depresses the hopes of the ardent gold-seeker.—[*Mirror*.]

This is a small volume intended for the use of miners and others, containing a glossary of scientific phrases, dissertations upon the mineral deposits of the earth, together with the most approved methods of extracting ores and metals. The work is profusely illustrated with explanatory plates, and from a cursory glance we should judge it well calculated to answer the purpose for which it is intended.—[*Spirit of the Times*.]

"**THE MINER'S COMPANION AND GUIDE.**"—This is the title of a very valuable book, written, compiled, and arranged by J. Silversmith, the able editor of the *San Francisco Mining and Scientific Press*. In consequence with its title, this work is intended as a cheap *VADE MECUM* for all persons who are, in any respect connected with the business of mining. It is, thus far, the only text book of its kind on the Pacific coast, containing full treatises for the working of mines, timbering, assaying, prospecting, reduction of ores, with the latest and most approved metallurgical process; also, an extensive glossary of technical terms. Every Californian should possess it.—[*Nevada Transcript*.]

THE MINER'S COMPANION AND GUIDE.—Published by J. Silversmith, "Mining and Scientific Press," office, San Francisco. This is a duodecimo volume of 320 pages, containing valuable information for the prospector, miner, geologist, mineralogist and assayer, together with a comprehensive glossary of technical phrases used in the work.—[*Era*.]

IMPORTANT TO INVENTOR

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE
Office American Patent Agency of Messrs. Munro & Co., and for
ten years officially connected with said firm, and with an experience
fourteen years in every branch relating to the Patent Office, and the
best of inventors

COUNSELLOR & AGENT IN APPLICATION

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND A
APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts. 2d Story, Washington

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other
ness pertaining to the obtaining of Letters Patent, will be executed
of \$25. For arguing the case in the event of a rejection, and for a
it to the Commissioner, no additional fee will be required. In case
reference or in an appeal to the Circuit Court a reasonable extra
will be made.

For a fee of \$5, a preliminary examination will be instituted at
tent Office, and a reliable opinion given as to the probability of securing
patent. More than four thousand examinations of this character have
ducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4

Learning that R. W. Fenwick, Esq., is about to open an office in this
city as Solicitor of Patents, I cheerfully state that I have long known him to
gentleman of large experience in such matters, of prompt and accurate
ness habits and of undoubted integrity. As such I commend him to the
inventors of the United States.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days
been as follows:

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, NOVEMBER 2, 1861.

NO 7.

DESCRIPTION WITH ILLUSTRATIONS, OF AN IMPROVED SHAPE OF FLUTED CRUSHING ROLLERS, AND METHOD OF FITTING UP THE SAME.

By MR. C. H. GIBBS, TRUST, F. R. S. S. A., MANAGER OF THE MARQUIS BRADSHAW'S MINES.

Ventilation of Collieries.

For some weeks past a discussion has been going on in the Mining Journal, relative to an invention patented by Mr. R. H. Hughes for ventilating collieries by forcing air into them instead of drawing it out by the usual method. In theory I must admit that nothing can appear more feasible, but in practice its utility has to be proved. No doubt there will be some difficulty encountered in finding a coalowner sufficiently speculative to adopt it; but I think that if Mr. Hughes can satisfactorily answer the following questions the doubts of a large number of your readers interested in the subject will be removed, and his object—that of securing the adoption of his invention—will be more readily achieved.

Mr. Hughes tells us that it is far better to force the air than to draw it out of collieries; but he does not give us any evidence in support of his opinion. Almost the sole cause of deficient ventilation is the failure to lead the air in the direction in which it is intended to be led; and I would ask Mr. Hughes whether it would not be more difficult to direct the air by means of pipes formed with innumerable joints, than by the ordinary galleries of the mines, where the only joints are the trap doors, which, by being made double, can be made perfectly safe, or, at least, practically so? But even supposing that the joints could be made tight, could they be made so by ordinary colliers? because if we are to have a staff of blacksmiths, plumbers and gas-fitters underground, Mr. Hughes would

have to prove that the working costs will not be increased.

There is one way, however, in which I think Mr. Hughes could speedily secure the adoption of his invention, and that is by proving that which he infers to be a fact—that air can, with the same sized machine, be forced into a mine in larger quantities than it can be drawn out. I am inclined to this opinion myself, as it seems very feasible that once the air forced into the pipes it must seek to escape (its escape of course being into the mine); but that although the same force be applied to draw air out, we may only get rarefied air, so that a much smaller quantity would be found to enter the part for ventilating purposes. This Mr. Hughes should at once turn his attention to; and I am sure he will gain both scientific reputation and pecuniary success in securing the adoption of his invention.

Colored Flames.—Mr. A. H. Church, writing in the *Chemical News*, states that blotting paper prepared like gun cotton, by ten minutes' immersion in four parts of sulphuric acid and five of strong fuming nitric acid, and then washed and dried, produces beautiful flames if soaked in chloride of strontium, or barium, or copper, or nitrate of potash. Pellets thus prepared and thrown alight into air produce a flash of intense light. The barium of salt gives a green color, strontium a crimson, potash a yellow, and copper a fine blue.

Extract of Hops.—M. Ramont asserts that he has obtained by treating hops by boiling water in a close vessel, an extract, which he calls *Honblomine*, which contains all the active, aromatic, bitter, and astringent principles of the hops; and that by means of this extract the manufacture of ale may be greatly ameliorated.—*Comos*.

this kind of buffers makes the motion of the rollers still more smooth, and adds to pressure and power of resistance.

In reference to the angle under which the rollers should be laid down, it is clear that it ought not to be above, but rather under, forty-five degrees, in order that the sliding of the rollers to and fro be gentle enough; and not with too great stress. Trials to this effect have shown an angle of from thirty-eight to forty degrees to answer best.

Oxalic Acid abounds in certain of our culinary vegetables; and it may be undoubtedly employed to a certain extent with impunity. Still, it is not a desirable ingredient in the human sustenance; and I am in the habit, when the opportunity offers, of telling housekeepers to throw away the first water which exudes in cooking rhubarb, now so generally used; that is to say, if rhubarb intended for tarts or pies be first heated in an oven, after being peeled and otherwise made or prepared ready for cooking, before the sugar is added, it will be found to discharge a large quantity of a watery, and, at the same time, very acid juice. When this water, containing mixed acids, is rejected, the rhubarb forms a very much more agreeable, as well as much more wholesome dish.—*Dr. McCormack, in the London Medical Times*.

OXIDATION OF ORGANIC MATTER.—Mr. G. T. Glover, writing in the *Chemical News*, recommends oxidizing organic matter for the analysis of the detection of mineral poisons, by conveying through the mass to be examined the gas evolved when chlorate of potash is treated with dilute muriatic acid. He represents this process as avoiding the inconvenience of mixing the chlorate of potash with the substance itself.

The wearing of rollers for crushing purposes takes place in the direction of the greatest friction, or in lines around the periphery of the roller. Therefore a much worn plain roller shows the shapes of teeth and grooves lying like rings around the periphery. To counteract so disadvantageous an effect, a series of ribs and grooves, constructed in the contrary or horizontal direction has been resorted to, and fluted rollers have been introduced. But it appears that sufficient inquiry has not been made into the shape of the ribs and grooves fitting best the requirements. The fullest and strongest ribs and grooves placed in the direction of the bevel line should be the best counteractors against the grooves and ribs produced by wear in the direction of the friction. Therefore it appears that, from among all different and imaginable forms to be chosen, the half circular one should be the best (Fig. 1.) Carrying out this view, a fluted roller is to be constructed as follows:

If, for instance, a fluted roller is to have six ribs and six grooves, twelve semicircles will wind themselves around the periphery. Describe, therefore, upon the outer periphery-line (Fig. 2) twelve full circles, and unite the alternate halves of each single circle into one curve. Since introducing the semicircular shape for the teeth and grooves of fluted rollers, I actually have found them to work by far longer and better than the shapes formerly used.

In further considering the effect of wearing, it will be found that one roller becomes dislocated a little from its central position to the one side, while the other turns into the opposite side. The consequence thereof is that the rollers, in the course of time, exhibit a kind of brims on opposite ends. Against this action a very efficient and simple construction has been proposed in Germany, by employing a guiding roller and a guided one (Fig. 3). The former gets on both ends a kind of brim or flat ring, of about one inch in thickness and height, while the guided one remains without this addition, but fitting itself nearly exactly between both these rings. Several years experience have given sufficient guarantee to recommend this construction of rollers.

THE LAYING DOWN OF CRUSHING ROLLERS.—Observing the violent blows and shocks to which a whole set of machinery is exposed in crushing-mills, where the relative places and situations of the rollers are regulated and strengthened so as to effect by powerful lever arms and by weight hanging thereat, I endeavored to remedy those evils. The first suggestion of employing powerful spiral springs have got no trial, because the proposition of laying the rollers upon inclined planes appeared more simple and sure. In this case the weight of the rollers performs a very useful and twofold purpose. Firstly, the weight assists the breaking of the stuff; and secondly, it makes the rollers slide down the incline on account of their gravity, after having been driven upwards the same length of the incline. Fig. 2 will readily explain the arrangements and provisions to be made:—*a* are the brasses in which the rollers move; *b* are pieces of iron to fill up all empty spaces on the one or other side of the rollers, which require to stand tolerably firm in the frames; the two iron pieces (*a*) on each side of each roller have in their centres excavations, into which pieces of India-rubber are so fitted that they project at least one half-inch, while they are as much in the countersink. It has been found that

Situation, Extent, and Boundaries of the State of Sonora, by Wm. F. Nye.

CAPITAL OF THE STATE.

The capital city, Ures, is situated in a most beautiful valley, stretching from east to west, the soil of which is exceedingly fertile, and suitable for the production of all kinds of fruits, excellent wheat and other cereals. Several hundred "cargos" of sugar are annually produced, also cotton of superior quality; but the progress of the place is slow, owing to the epidemic which visits it every two or three years.

The environs of Ures are picturesque, and contain several important haciendas of arable land, such as Santa Rita, Molino, Guadalupe, Topagni and others. There are no public buildings, except certain small houses purchased during the administration of General Urrea to form a palace. The present Governor is erecting a penitentiary, or house of correction, there being but one prison on the skirts of the city, and that extremely insecure.

The private buildings are irregular, frail, and with no pretensions to beauty. All are built of adobe, although there is excellent stone for building in the neighborhood of the city.

Ures has the great misfortune of being subject to frequent inundations, since it is immediately surrounded by various creeks, which, when swollen by heavy rains, constantly threaten the city with ruin. Its principal branch of industry is the manufacture of mantillas, but much progress might be made in other branches, under a quiet and peaceable order of things.

It is particularly exposed to the depredations of the Apaches, notwithstanding which its population has materially increased since 1825; this, however is partly owing to the emigration from the frontiers, of many, who, having witnessed the slaughter of their families by the savages, sought refuge and protection in the city.

Ures has an ayuntamiento, prefecture, judge of first instance and a primary school. The attorney general also resides there, but the Supreme Tribunal of Justice holds its sessions at Hermosillo.

CITY OF HERMOSILLO AND ITS DEPARTMENT.

The capital of this department is the city of Hermosillo, distant from the Gulf of California thirty leagues on the west, and thirty-six leagues on the south. It was originally called Pitic, having been one of the old presidios. It is now the first town in the department, its elements of progress being certain and increasing. Its climate is dry and very warm, from the middle of spring till the beginning of autumn, the thermometer frequently reaching ninety six or ninety-eight degrees Fahrenheit, and sometimes over one hundred; but immediately after sunset, a refreshing westerly breeze springs up, which compensates for the intense heat during the day. The winters are not severe, and their temperature is very variable, sometimes rising nearly to the summer heat. The atmosphere during the greater part of the year is clear.

No epidemics visit this city, excepting catarrhs and light fevers; neither are there any noxious insects, the only ones found being ants, the bite of which is neither painful nor dangerous.

It is situated in a valley about three and a half leagues in length and one and a half in breadth, sheltered on the north by various hills, on the west by the range of hills called Chanate, and on the east by the "Cerro de la Campana"—hill of the bell—so called because its rocks, when struck together, produce a sound similar to that of a bell.

The base of this hill is bathed by a small stream running from east to west, which is sufficient to irrigate the lands between San Juanico and Chanate cultivated by the inhabitants of the city, and of the pueblo of Ceris, which is in sight to the south; the said lands being in length from east to west, four or five leagues. A large aqueduct passes through the middle of the settlement, which also serves for irrigating the neighboring lands; another passes near the river and the "Cerro de la Campana," and a third divides the city north and south, furnishing water to the houses, orchards and gardens in the immediate neighborhood.

Hermosillo, according to the last census of 1840, contained 11,655 inhabitants, to which should be added 2,000 Yaqui Indians, making the total population 13,655. Its present population—in 1843—according to the regular rate of increase, should not be less than 14,000.

The average annual quantity of its agricultural products, as near as we can estimate, is 25,000 fanegas of wheat—about 64,000 bushels; 100,000 fanegas of maize, and 5,000 of other cereals, beans and lentils.

There are also raised in abundance, Chile pepper, onions, gourds of all classes and sizes, and sweet potatoes. Other vegetables are scarce, as they are seldom cultivated.

The fruits are abundant, and of excellent quality, especially the grapes, musk and water melons, and figs grow in such profusion that large quantities are wasted; poor people are permitted by the owners of land to gather all that fall from the trees. Sweet and sour oranges, lemons, citrons, limes, pomegranates and peaches, are also abundant, though not equal to those of Arispe and San Ignacio. The guava is cultivated, and the plantain tree attains a large size, and is loaded with fruit, which gradually fall as it ripens.

The cultivation of the vine has teuded much to the aggrandizement of the city. The average annual product of the grape is 1,500 barrels of agaviente of one hundred and twenty-five quarts each, as many of vinegar, and but a few

barrels of wine; since it has been found impossible, even with the greatest care, to make good wine it invariably turning sour on the approach of hot weather. But few raisins are made, and these are of inferior quality. We have heard from various proprietors of vineyards that their profits were two, three and four thousand dollars per annum; but, if they exercised greater economy, and possessed sufficient experience to manufacture wines and brandies equal to those of Europe, their gains would be infinitely greater.

The cultivation of cotton was commenced in the year 1811 by several persons; among them, Don Rafael Diaz, who succeeded in raising good crops, and manufactured narrow cloths half a yard in width. For two or three years this enterprise steadily advanced, but then an incurable disease attacked the plant, and after many fruitless attempts to remedy this, its cultivation was abandoned. This continued until 1842, when a few persons, stimulated by the establishment of the cloth manufactory of Los Angeles, took steps to revive the cultivation of cotton, and there are now several considerable plantations on the estates, four to eight leagues to the west of the city, called Tenna and Palomos, and at Chino Gordo, four leagues to the east.

The cultivation of the sugar cane has also been unsuccessful, the general opinion being that neither the soil nor climate is suitable for this plant; some "cargos" of sugar, however, are produced, mostly in San Juanica and Ceris. Within two years, the cultivation of the large cane of the coast has been commenced, and this, if successful, will be an important branch of agriculture.

The soil of Sonora is not generally fertile, though more so in some parts than in others. Upon a hacienda of Messrs. Astiaseranes, and that of Topajui, on the road to Ures, the average yield of wheat is two hundred and fifty or three hundred to one; and many others are equally productive. In the haciendas of Hermosillo, the yield, though not so large, is still respectable, being from one hundred and fifty to one hundred and seventy to one from the better lands, but not more than fifty to one from the least productive.

The public buildings are: First—the mint, which has been idle for some years, for want of direction and supplies, and now serves as barracks for the troops. Second—the assayer's office, which is much dilapidated. Third—the municipal buildings, including the prison—almost in ruin—and the primary school. This school is now held in a building purchased by the city, and is in charge of Don Antonio Villalpando. It consists of two departments, male and female, and the number of pupils exceeds one hundred; public examinations are held every six months. The principal plaza, in front of the church, is four hundred varas square, two of its sides being enclosed by private dwellings, and the other two by the church and municipal buildings. The church was built when Hermosillo was the presidio of Pitic, and is sadly in want of repairs. It is poorly supplied with sacred utensils, but three of which are of silver, viz: a cibary and two censers. The former is valued at two thousand dollars.

To the west of the city is a chapel, dedicated to San Antonio, which is fast failing to decay on account of the encroachments of the river, and has consequently been abandoned. On the east is the chapel of Nuestra Señora del Carmen—small, but in good condition—and a ruined chapel on the north.

The trade of Hermosillo was formerly carried on with the city of Mexico, but at present it is confined to the port of Guaymas.

There are about twenty-five or thirty shops and mercantile establishments in the city, and only three or four merchants called capitalists; all others transact business on credit, and are frequently compelled to borrow on interest to meet their engagements.

The exact value of the goods annually used and consumed in Hermosillo we cannot positively state: but to the best of our knowledge, it is not far from \$100,000.

There is a small market for the sale of meat, fruits and vegetables: but, in the absence of proper regulations, it is neither cleanly nor commodious. There are no regular bakeries; and consequently, in a country that produces an abundance of excellent wheat, is almost impossible to procure good bread.

Inns, hotels, or public houses, are unknown. Travelers supplied with letters of introduction take up their quarters in private houses; those not so fortunate must either hire apartments, or, failing in this, encamp under the trees outside of the city.

The towns belonging to the department of Hermosillo are six in number, of these Guaymas is the most important.

It is situated on the Gulf of California, on the western coast of Mexico, in latitude 27° 22' north, and longitude 104° 30' west of Cadiz. It is completely sheltered from the sea and winds, and is one of the best harbors upon the Pacific. The entrance runs north and south, and is formed by the island of Pajaros on the east, and the islands of San Vicente, Pitayas and Tierra Firme on the west. There is also another entrance, called Boca Chica, formed by the island of Pajaros, on the south, and the beach of Cochui on the north. The length of the bay is four to five miles. The bottom is muddy, and when vessels remain for some time, it is necessary to sight the anchors every fortnight. The depth of water at the island of Pajaros is seven fathoms, which gradually decreases to two alongside the mole. This latter, according to the opinion of mariners, is one of the best on the Pacific, excepting that at Callao. The depth of the water at the anchorage is three fathoms, and vessels drawing fifteen feet is

loaded, discharged and hove down with facility. There are three landing places; but no fortifications, although there are several points well suited to the purpose.

To be continued.

THE MINER'S COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines: metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide," a compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work. It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its Character: and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

THE MINER'S COMPANION AND GUIDE.—In a recent notice of this invaluable work, we omitted to give some of its leading features of interest and value specially designed for our mining community and metallurgists. This book has been carefully prepared and published by the enterprising editor of the "Mining and Scientific Press," of San Francisco. It contains nearly one hundred fine illustrations, with three hundred pages of interesting and instructive matter, forming a neat little volume substantially bound, at the low price of two dollars. It is thus far the best mining work issued on this coast, having complete treatise on veins and lodes, timbering of mines, manual of metallurgy, the geology of California, and the most important of all, many new and interesting methods for separating gold and silver ores, and pyrites together with a glossary of technical terms not contained in any other work. The miners of this coast will find this an indispensable hand-book. Every California should possess it.—[Sac. Bee.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins, and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notices also of the methods of reducing them to metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work is the "Miner's Companion and Guide," and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and given in good and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINER.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining territory, and for its price, we earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's rugged soil its hidden treasures.—[Union Temperance Journal.

Book Dealers and others will please send orders through mail or express to the office of this Journal.—Liberal percentage allowed.

SALES MINING STOCKS.

(Revised and corrected every week.)

The sales of Mining Stocks for the past ten days have been as follows:

WHEELER & WILSON'S

FAMILY SEWING MACHINES:

NOT ONLY

THE BEST FOR FINE SEWING,

...BUT THE BEST FOR...

MANUFACTURING CLOTHING

...AND...

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cassimere and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them cannot be surpassed.

Various styles of Machines have been employed on the above materials, but the Wheeler & Wilson is preferred.

DONALD MCLENNAN,

Proprietor of the Mission Woolen Mills

A. ROMAN & CO.

Booksellers, Importers, Publishers,

507 MONTGOMERY STREET,

SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 360 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; including full descriptions of Species, Chemical Analyses and Formulas, Etc., Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Rudimentary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lamborn.

The Discovery and Geognosy of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Disquisition on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supersede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that 1st—That it is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silver-smith, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.
 Mr. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Reaper and Mower work, and in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.
 Yours, truly,
 G. W. HAMMERT, A. BALDWIN,
 M. CHONGER, CHARLES MCCARRON,
 D. R. MEACHAM.

June 12th, 1860.
 Mr. STANDISH—Sir: Your Mower was tried in my clover meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harner's field, and I am pleased with its performance. The cam wheel power over that of the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear as the cog wheel. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging-bearings and boxing, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.
 Yours, with much esteem,
 ELAM BROWN.

PACHECO, June 25, 1860.
 Mr. STANDISH—Sir: This is to certify that I have operated one of your mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife in clover, or cut any grass.
 Witness: Washington A. Wilson, W. T. Hendrick.
 G. F. BROWN.

LAFAYETTE, June 27th, 1860.

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. Further particulars at the office of the Press. ap19

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved
 ANALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over the old mode of use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.
 2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.
 3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First Street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars inquire of the Patentee,
 J. D. BEERS
 165 Clay street,

LEWIS COFFEY & RISDON'S

STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Boiler Making Establishment on the Pacific Coast. Owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market Streets.
 Opposite Oriental Hotel, San Francisco, Cal.

LEWIS COFFEY,

J. N. RISDON

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....NOV. 2, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

Inventors and Discoverers.

At no period in the history of the civilized world has there been greater progress in science, art or mechanics, than the nineteenth century. From our valuable exchanges of Europe and America, we learn that most wonderful discoveries in all the sciences have been made and entered for the special benefit of their inventors and the public. Though thousands of inventions and improvements are daily recorded yet, a few important subjects require the aid and knowledge of the scientific gentlemen and savans. These are:

1st. To complete the decarbonization of coal, that is to save or concentrate the carbon lost, either by means of smoke or in the residues.

2d. Bodies propelled through air by some of the known motive powers.

3d. The winning of fine atoms of gold or other precious metals floating in the streams from our placer mining districts.

California thus far has been the most prolific in furnishing some highly creditable and scientific inventions, many of which have obtained immediate renown and the application to their uses. Among recent inventions we may mention Matteson's Centrifugal water power, Dunning's Under Current Sluice Box, Bauham's New Amalgamation Process, and others too numerous to mention, all of which are particularly adapted to the interest of our mineral resources and

wealth. There is one more subject to be discussed, between the scientific men, inventors and discoverers on this coast, who are probably not aware that we are now successfully employed in securing them against infringements of their inventions, the application of Letters Patent, Caveats and all other matters pertaining thereto.

We often notice inventors are timid in making inventions known to the public before making application for patents; we wish to say to such that no fear need be entertained, since the first publication of any new invention or improvement establishes the right of priority in all cases of interferences; on the other hand, it would fix at once the attention of the public to the subject, cause inquiry respecting the same, and in many cases (more especially in this country, where sales have been effected for Counties, States and Territories; thus bringing to the inventor emoluments, and a ready return for his discovery before even the patent has been fairly granted.

We publish the only "Scientific or Mining Journal" on this coast—have all the Patent Reports, Forms, etc. Artists and engravers are constantly employed in filling the many applications now entrusted to our care. Our attorneys at Washington reside immediately opposite the Patent Office, and enquiries of every nature can now be answered through telegraphic despatches at a nominal cost, if necessary. We are at all times ready to consult with inventors, and point out to them the most economical mode of procedure, in their cases, and render them such aid and services through the columns of the PRESS as will materially benefit them.

The Largest Boilers in the State.

Messrs. Coffey & Risdon, our enterprising Boiler Makers on Market street, have in course of erection two large boilers, intended for a new river boat, for the C. S. N. Company, which has not yet been named. Over 5,000 feet heating surface, with the combination of tubes and flues, the most approved mode of recent discoveries, in this branch of industry, will be the leading features of this gigantic piece of mechanism. At this establishment were recently turned out the boilers for the Gould & Curry Mining Company in Washoe. This firm are decidedly popular in their particular sphere, and we are informed that they cannot fill, with fifty hands employed, all the orders now on their file.

Caution.

A few of our patrons have been tampered with recently by a *thing* possessing more knavery than most human beings. Some unknown friend, since this dastardly conduct, pasted the following sentence on our desk: *False friends more dangerous than open foes*, which at once opened our eyes, and which we shall keep sharply directed to the maneuvers of this base coward, who has within our own hearing slandered us, and driven away from our office persons on business, and otherwise attempted to deprive us of our benefits arising from certain branches of our pursuits.

Pacific Metallurgical Works.

We have learned that this establishment for the past week have been employed by day and night, doing an extraordinary amount of testing, assaying, smelting and refining of rich ore, especially that of the Gould & Curry, and some Mexican ore brought from the vicinity of Acapulco. We called in at the company's office of Messrs. Bradshaw & Co., where we were shown some silver bars, which were obtained by a new process, said to be less expensive than that employed by the U. S. mint.

Among recent inventions we may mention the new quartz or ore crusher, of Mr. Coleman, which in our opinion will supercede many devices already in the field. He is still engaged in perfecting the same, and when completed, we shall be pleased to make a synopsis and illustration thereof.

ON THE PRESERVATION OF YEAST.—M. Changy, a French chemist, states that yeast, whether solid or liquid, if mixed with a certain quantity of animal or vegetable charcoal, and afterwards dried, either by current of air or a rotating apparatus, produces a powder which preserves for an unlimited period its fermenting properties.

The following short epistle on co-partnership in mining operations is truly characteristic; it deserves a place in our columns and we therefore tender our thanks to the Yreka Journal. Verily it contains "more truth than poetry."—There are several hard working young men, who, anxious to start in mining enterprise, engage in it jointly with other partners, who often turn out to be troublesome, and even ruinous. Many men are associated in mining claims, some of whom become addicted to drinking, gambling and indolence. People may say "shut down" on such, or "freeze them out," but that is a hard matter, and creates much expense and annoyance to companies or individuals. Then again, a little capital is necessary to go it alone, and perhaps even then will not justify paying wages. Every one should be careful who they go in partnership with, and how they do it. A good, honest, industrious company cannot help making money, and will enjoy it without being obliged to give it to the law or squander it by selfish dissatisfaction. When in such a fix as disagreement, buy or sell quick, and money will be saved by it, no matter what sacrifice, unless all can be sold to other parties. Content yourself for a new start, and keep in mind the old song:

Trust to luck, trust to luck,
Stare fate in the face,
Sure your heart will be aisy
If its in the right place.

On the Cleaning of Glasses, etc.—There is often a difficulty in cleaning glasses or porcelain capsules to which organic matters have adhered and in course of time have become so hard and dry as to resist all solvents. The following process will be found to answer in almost every case: The spots to be cleaned are moistened with concentrated sulphuric acid, and powdered bichromate of potash is sprinkled upon the acid; the objects are then left standing for some hours (through the night) in a moderately warm place. All organic matters are by this means destroyed, with formation of sulphate of chromium, which may be removed by water with the residue of the acid.—*Dingler's Polytechnic Journal*.

An Impervious Paper has been patented in England, which is prepared in the following manner: A solution of soap is added to the paper-pulp in the proportion of two ounces of solid soap to every gallon of pulp and when thoroughly incorporated, enough of a solution of alum is added to decompose the soap and form a compound of the fatty acid and alumina. This alumina-soap replaces the sizing, and renders the paper manufactured from it impervious to water.

Paper Parchment.—Mr. Thos. Taylor communicates to the *Chemical News* a new process of making this curious substance. Instead of immersing the paper in dilute sulphuric acid, he employs a concentrated solution of chloride of zinc. The paper is reduced in volume, but made tougher, stronger, and semi-transparent. The highest effect is produced by using the solution hot. Pieces of paper thus saturated can be united by ironing.

New Material for Pencils.—Some black lead in powder mixed with Indiarubber solution, a small quantity of lamp-black and some finely powdered charcoal, are incorporated together and subjected to great pressure. This forces all the moisture and reduces the mixture to a hard block, which may be subdivided and cut into suitable lengths for pencils. A patent has been taken out for this pencil composition by S. J. Cole, of London.

Means of Removing the Rancidity of Butter.—Wild recommends that the butter kneaded with fresh milk and then with pure water. He states that by this treatment the butter is rendered as fresh and pure in flavor as when recently made. He ascribes this result to the fact that butyric acid, to which the rancid odor and taste are owing, is readily soluble in fresh milk, and is thus removed.—*Pharm. Jour.*

CENANTHIC ACID.—It will be remembered that Liebig and Pelouze many years ago announced the discovery of an ethereal essence which gave rich flavor to the wine, and which they styled cenanthic ether. Their researches were followed up by other investigators, and cenanthic acid took its place in chemistry. Mr. A. Fischer now announces that this acid does not exist, and that what has received the name is merely a composition of caprylic and capric acid.

QUINIC ACID IN THE HERB OF THE WHORTLEBERRY.—Messrs. Zwenger and Tiebert (*Annalen der Chemie u. Pharmacie*, July, 1860) have found that several plants belonging to the family of Ericaceae, among them the *Vaccinium Myrtillus*, whortleberry, contain a considerable proportion of quinic acid, identical with that obtained from Peruvian bark.

NEW DYE.—An Austrian is said to have discovered a carmine dye in the Chinese sorgho. The plant is allowed to ferment, and then treated with caustic soda or potash, which dissolves the coloring matter. It is then precipitated by sulphuric acid.

SUMMARY OF MINING NEWS.

To Miners and Mill Owners.

We respectfully request all persons interested in the Mines, Quartz Mills, or in any prospecting expedition; also the owners of the different mining districts to forward to us at all times, such information concerning the condition of the mines and lulls in their vicinity, and description of lodes, as they may think will prove interesting or useful to the public for publication. Records of mining districts will oblige by sending us their address.

CALIFORNIA.

Mineral news from this State is decidedly limited this week. We receive considerable matter from our enterprising Territorial neighbors—telling news of rich "strikes" large "nuggets," etc. We are again apprised that new silver and coal leads have been discovered, particulars following in detail in this Summary. Many miners are anxiously waiting for the first of the season, which we trust will soon "bring down the dust."

Yreka County.—The Yreka Journal says there is a fair prospect of the hidden treasure of the Holt's Hill country will before long be developed. Messrs. Stewart & Ingraham of French Gulch have just secured the right, to the lode they own, and are bringing a ditch to the lode. These gentlemen, we believe are all practical miners, and about a dozen men employed on their ditch. The water is taken from French Gulch, above Bates & VanMetre's ranch. The ditch will be twelve feet long, and from Holt's Hill will be two hundred feet above the river. The ditch will be completed next season, when there will be water and good ground for hundreds of miners. Alexander & Williams have commenced a ditch from Colville's Creek, which will command the high diggings. They are informed that six companies are preparing to work with hydraulic water. The gentlemen have lately bought the water right and land of Winkle & Lauer, and are on the road to prosperity. . . . Mr. Hill, who west end of Miner street is extending a drain some one hundred and a half feet of Pine street, under the buildings on the north side of Miner street, where gold pay had been prospected in the vicinity of Jimmy Robinson's saloon. . . . From Trinity County we learn that very little is known. The great reason is scarcity of water. Swift Sarc creek is all that is ever known. Great activity in the way of preparation for mining is reported. Like all the other important mining towns in the county, the great prevention to wealth and prosperity is the scarcity of water. Swift creek, Colville creek and Trinity river are all adjacent, but the water required to make the water available is not there. . . . McGill & Son have lately built a flume on Yreka flat, known as the Telegraph flume, leading from Yreka ditch, which they put in operation last Saturday. It is about half a mile long, with two main shafts, the sum of \$25. The flume is all of seventy feet, giving a strong force of water. The ground is level to the bed rock, and pays from the surface down. The creek in the bed rock are very rich. Therefore they will only wash up after a little work. Saturday's washing up was only an experiment.

Yavapai County.—A correspondent of the Tucson Courier writes: Coppraholis has that appearance of newness which characterized mining camps of 1849. Instead, however, of cloth and logs, lumber is in both plenty and cheap and numerous sawmills are prepared to meet the wants of the locality which, by any new discovery of gold diggings, may itself as a point for a town. Almost every branch of industry necessary to the carrying on and improvement is conducted in the order of the progress of a large hotel, doing a flourishing business, but the other branches of the (national in new towns) existing one small brick roof above. At present the workers are embarrassed, for the want of water capital and mechanical appliances. The inflow of water and the facilities for draining and delivering the ore to the surface will eventually be overcome, and the work be prosecuted with more advantage and speed.

Yavapai County.—The "Press" gives the following account of an explosion: A blast of seventy kegs of powder, was put off in the mine claims on Monday evening. The chamber in which the explosion took place, was under a sixty foot bank. The effect, we are informed by Mr. S. Brown, was charming. Two runs of ten days each, have been effected by the loose earth tumbled down.

Yavapai County.—The T. Courier remarks: On the 23d of Oct., Mr. McGuire, while engaged in cutting a road to a wood-lot in Experimental Gulch, near Columbia, found, a little beneath the surface on the left, a lump of pure gold—mixed with quartz or any other substance, which was sold to Mr. Sloop the banker, for two hundred and fifty-four dollars.

Yavapai County.—A Mr. Rice has discovered a coal mine on the Fork of Sloney Creek, in the Territory, which, judging from specimens exhibited the editor of the Independent pronounces to be of a superior quality, and the vein is said to be extensive.

Yavapai County.—The Red river presents a very harrowing appearance, says the Sierra Democrat. The Melicun and Chiamun are taking dirt from the bed rock at very great depths, and are making money by it.

NEVADA TERRITORY.
Growth of Population.

HEMLOCK MINES, N. T., Oct. 14th 1861.

MINING AND SCIENTIFIC PRESS.—Within the past two months there has been a considerable addition to the number of people in these mines. The census report by Dr. Degroot showed about four hundred persons here in the month of August, whereas, we now nearly double that number. This accession has been made in part from the overland immigration, but mostly from the mining counties of Nevada, Plumas and Sierra, and is, consequently, largely composed of experienced miners. Most of these now here intend remaining through the winter, having made ample preparation for that purpose. With the coming spring we look for a large influx of population, some calculating it by thousands.

THE CLIMATE.

Withstanding these mines are more than a hundred miles further north than those of Washoe, the climate is much more equable; the winters being milder, with less snow at the same altitude, and the summers cooler here than there. The mountain range in which the mines are situated is about twenty-five miles long and fifteen miles wide, having an average elevation of the adjacent plains of some two thousand five hundred feet. Certain peaks are higher, and upon these snow is to be seen until the month of August, moderating, by its presence, the heat, and keeping the streams full, and water cool throughout the summer. On the plains the heat is very great during the summer season, but moderate as we ascend the mountains. The Humboldt Lake and along the river and slough, the mosquitoes are troublesome in warm weather. There is also a variety of large flies in the localities that are terrible among animals during the day—the mos-

quitoes attacking both man and beast during the night; so numerous, and sometimes as these insects that the traveler is unable to sleep, nor does his animal get a moment's rest in the whole twenty-four hours. For about five months in the year these pests hold reign, causing one to dread a passage through the region they infest.

There is but little snow in the valleys and upon the plains here, even in winter. It never falls more than five or six inches deep, and rarely lasts more than a few days at a time. Occasionally it may continue for a couple of weeks, when it melts, leaving the ground bare for the remainder of the winter. As we ascend the mountains the snow grows deeper, the quantity being regulated by altitude and exposure. At this place, which is six or eight hundred feet above the river, it lays pretty constantly for a couple of months; while in the districts still higher, it remains proportionally longer—lingering as I have said, in the deep ravines on the north side of the latter peaks, until late in the summer. For the past two months the weather here has been cool and pleasant, nor do we look for any uncomfortable cold for a month or more to come. We have as yet had scarcely any rain, nor do we look for falling weather till the middle of November, about which time, some years, a few weeks earlier, the rain or snow commences. Last year the weather remained clear and pleasant until the 20th of December, when there was a heavy fall of snow. The year before about six inches of snow fell early in November. It disappeared in the course of a few days, after which the winter was mild and open until the month of March.

FUEL AND LUMBER.

The greatest hindrance to the progress of this country, especially the development of the mines, is the insufficient supply of wood for coal, and the entire absence of such as will serve for lumber. The only trees within a hundred miles of these mines are a stunted kind of cedar, which, at most, will only answer for fueling up the mines, for posts, fire-wood, &c. Not a stick fit for framing or for a saw log is to be found in the entire country. There was a report that better trees grew in a mountain range some thirty miles to the east, but of this I can find no confirmation; and the probability is that we shall have to get our supplies of lumber from Honey Lake, one hundred and forty miles distant. Of this cedar there is only enough to last a few years, if any considerable number of steam mills shall be set in operation. The growth is not only small but scattered, and the wood, being of a light and porous texture, affords scarce half the heat emitted by the Pinon, found further south. Nor have we any great amount of water-power as a substitute for steam, the only force of this kind being afforded by the mountain streams, of which there are several, though generally small. With limited water-power and a scanty supply of wood, most of the ores from these mines will, after a few years, require to be shipped abroad for reduction, unless coal shall, meantime, be found near by—an event of which there is no very good prospect.

MINING PROSPECTS.

Throughout this entire section there have now been located something like two hundred lodes. Of this number, one quarter perhaps, are worth working—at least yield under ordinary tests, a fair show of the precious metals. Some fifteen or twenty tons of rock taken from some of the lodes, have been sent to your city for reduction, but from which as yet, so have received no definite returns. One lot reported to have paid expenses, or, in other words, yielded some two or three hundred dollars to the ton. We also sent it to the Mining and Scientific Press, that certain portions of this rock yielded fifty-three dollars seventy-eight cents in silver to the ton, with a mere trace of gold. About this we think here there must have been some mistake, unless, of course, it was a small sample of the rock, taken from some manifestly worthless lode. Of all the claims heretofore making pretensions to value, we are satisfied the poorest will do much better than that.

The silver ore found in this region consists mainly of an argenteous galena, and yields by assay of selected portions, from one hundred dollars to one thousand dollars per ton, in silver. With the argenteous quartz there is a much greater margin—the assay running from a few dollars up to two or three thousand; but it is well known an assay is of no value, only as the means of detecting the worth of the ore. The people here, therefore, are people here having taken the proper course to test their claims, by procuring a fair sample of their rock to be crushed, are now naturally anxious to learn the results. If these mines will not pay for working, I can only say appearances are deceptive, and assays of very little use.

MISCELLANY.

Early in the season both tools and provisions were scarce and dear, now they are here in good supply, and selling at fair prices. Money, however, is exceedingly scarce, and if comfortable clothing was selling at half the present rates, some poor fellows would have to go without. It is impossible to sell even the best of mining ground at more than nominal prices; and this being about the only property the inhabitants possess, many of them are sadly pinched for means to procure the necessities of life; yet such is their claims, that the poorest here are resolved to hold on and see what they will come to.

This has been a very orderly and well behaved community from the first: fighting, shooting, and the like being of rare occurrence. We have also had less contention about town lots, mining claims, &c., than is common in new places. The climate here seems healthy, there being but few cases of sickness or other ailments; nor have any accidents of a serious nature occurred among our people. During the winter a large number of claims will be opened, and their character established. In the spring it is expected mills will be brought in, and the business of extracting the precious metals largely engaged in.—H.D.

There are yet over twenty miles of available water power on Carson river and at least thirty miles more on Walker river, but taken, and any quantity of quartz can be had to crush, contiguous to the streams, which would pay some one hundred dollars per ton, and it is said that it is a profitable investment to erect quartz mills on the more eligible sites? Four quartz mills are now in operation, and six more are in process of erection at Esmeralda. The rock yields from \$150 to four hundred dollars per ton and is easily quarried and crushed. The town of Aurora is improving rapidly. Quite an excitement was created at Carson the other day, by the arrival at that place of several large chunks of coal from the Whitman lead. The quality of the coal is excellent, and with the present limited facilities four or five tons a day can be brought out. . . . Rapid progress has been made in the settlement of the Humboldt mines, since the discovery of silver and gold bearing rock in that desolate region, about a year ago. The Territorial Enterprise, of the 16th instant, speaks of people flocking thither from the northern counties of this State in such numbers as to keep the Honey Lake road lined. They are mostly taking their winter supplies, and intend to spend the winter here, and then return to their homes in the direction of the gold range, as far as discovered and prospected, is about three hundred miles, with an average of one hundred miles. It is divided into nine districts, which will soon all be thickly settled. The winters there are milder than at Virginia City. The Enterprise adds: Gold predominates, but percentage of silver is found to warrant the belief that as they go down upon the leads, they will prove to be rich in the latter metal. Lead is found in all the rock in considerable quantities. Antimony and arsenic are found in about the same proportion as in the ore found in our vicinity. Quite a number of scientific men are now investigating the character of the ores, and sciences and capital will next season prove the value of that region.

WASHINGTON TERRITORY.

Nez Perce District.—The following letter was received from Dr. C. Hawthorne of Oro Fino, containing the news of important and rich discoveries of gold upon Salmon river and its tributaries. The well known judgment and calm investigating character of the Doctor will give creditability to the matters stated. It is written to his partner Doctor Loryea:—

Oro Fino, October 12th.

DEAR DOCTOR—Yesterday morning our quiet little town was thrown into a state of excitement never before known here, caused by the report of the discovery of extensive and fabulously rich mines on Salmon river and its tributaries, about eighty miles from this place in the Nez Perce district. The report was first brought by a Mr. Miner, a merchant of this place. He brought ten dollars and fifty cents taken from the washing of one pan. The gold is coarse and very pure; also another lot of what is called shot-gold twenty-five dollars worth of which were panned by himself out of a single pan of dirt. In the claim from which he took this, a Mr. Hull its owner,

look out in one day five hundred dollars with the aid of a single rocker.

Three diggings are situated in small streams and gulches, which make their way between and among an almost innumerable number of small hills. The dirt is from three to five feet in depth with just dirt of a red color of sand and quartz gravel from six inches to two feet in thickness. This region is bounded on either hand by mountains. The miners from the peculiar situation of the country, have given these hills the name of the Hole in the Ground. The gold is very heavy and I should think of a good quality. Mr. Miner says that on the Salmon river there have been many places found that pay from ten to twenty dollars a day to the land, that are neglected on account of the much better diggings waiting to be worked. Others have come in and confirm the statements of Mr. Miner, giving additional facts that have come within their knowledge. The following was told me by those who dig from the ground: The gold district is from twenty to fifty miles in extent, running up to the old Hornum settlement on Salmon river. Two men worked out in two hours eighty six dollars, and many say that they have seen as much as twenty-five dollars washed out of a single pan of dirt. This man thinks one dollar and a half is the average to a bucket. J. W. Snags, of Lame County, rocket out in one day four hundred dollars, and then sold out for three thousand five hundred and went home. A Mr. Osborne back with their pack of three thousand for his claim, but refused to sell. Two others who have come in think that the diggings will average ten cents to the pan at least. They have seen as high as six dollars, and have heard and think it true that from an ounce to twenty-five dollars have been taken from a single pan, and that from twenty-five to thirty dollar diggings are easily found, and none make less a day with the aid of a rocker. They had started three shovels when they left. There is no provision in these mines; those who have come back will return immediately. Mr. Jesse, formerly of Yamhill county (now County Judge of Oro Fino district), has contracted to dig in the diggings of thirty-two cents per pound, paid in advance. All the elements in the main points with whom I have conversed, and from the news I am of opinion these mines are much richer than the Rhodes' diggings. I think with rockers can make from twenty to thirty dollars a day on an average. There are many claims which will pay much more, but they do not constitute the rule but the exception. Many exaggerated stories are afloat that tend to throw suspicion upon the whole, but I have no doubt that the opinion I have given above is very nearly correct. I have seen the elements in California and am not over credulous as to mining news or reports, but this comes so well authenticated, and is couched for by men who are well known here, who have no possible motive for practicing deception, that I am forced to the belief that very rich deposits of gold have been found. The best proof of such reports is that those who give intimation to the public have not been asked to show the gold, and I have seen the lode they intend to develop. I have given above is very nearly correct. I have seen the elements in California and am not over credulous as to mining news or reports, but this comes so well authenticated, and is couched for by men who are well known here, who have no possible motive for practicing deception, that I am forced to the belief that very rich deposits of gold have been found. A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and fowl matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be dispensed by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other fowl stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plater or runner of each sett is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the smut balls, oats, chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals, whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. SILVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

Imports from January 1st to September 15 :			
Anthracite, tons	16,903	Sydney, tons	11,304
Cumberland cks	1,144	Japanese tons	25
English, tons	14,165	Vancouver I, tons	4,536
Chili, tons	9,135	Coast, tons	11,384

The sales of 3000 tons Anthracite, to arrive, which occurred some little time since, and were not made public, are the only transactions of moment which have come to our knowledge. They were effected at \$18 @ 19 3/4 ton, with some slight resales at \$20. Our quotations give a true index of the market.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For pining silver from gold when gold is below 300-1000ths fine	3cts per oz.
" from 300-1000ths. to 750-1000ths fine	7cts " "
" " 750-1000ths to 950-1000ths " "	14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight

301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges a in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge of 1/2 per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register as most congruous with the physical aspects of the material but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

TEETH! TEETH!
Extracting with out Pain! Dr. W. H. Lewis, Dentist, Third at near Howard (opposite E. till's Mansion). All branches of Dentistry performed in the neatest manner.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to a re- mote extensive establishment, we can confidently announce to the public that we now have The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty five thousand dollars worth of patterns, we are en- abled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Steam-shovels and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mulley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamator, with the latest improvements; Howland & Han- com's Amalgamator; Goddard's Tab, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Air Wheels and Axes of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Linn's Pat- ent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Scientific work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour ter arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and ye simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS
Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Barbora Mill Company, }
Ogden Mining Company, } San Francisco

Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Dura- bility, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXPERIENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to un- even surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver aving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, can for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchas- ing. KNAPP, BURELL & CO.,
ap10 310 (Old No. 80) Washington street, near Front, San Francisco.

Physics and Chemistry.

On the propagation of heat in gases.—MAGNUS has communicated to the Royal Academy at Berlin, a memoir on the propagation of heat in gaseous media, the principal results of which are as follows:

1. The temperature which a thermometer finally assumes in a space which is warmed from above is different when this space is filled with different gases.

2. This temperature is higher in hydrogen than in any other gas.

3. The temperature is also higher in this gas than in vacuo, and the greater the density of the gas, the higher is the temperature.

4. Hydrogen therefore conducts heat like the metals.

5. In all other gases, the temperature which the thermometer finally assumes, is lower than in vacuo, and the more dense the gas employed, the lower is the temperature.

6. We must not however conclude from this that gases do not conduct heat, but only that they do this to so small an extent that the action of the conduction is counteracted by the resistance which they oppose to the passage of heat.

7. The remarkable conducting power of hydrogen is shown not only when this is freely moveable but also when it is contained between pieces of eiderdown or any other substance of a loose texture which prevents its motion.

8. All gases, hydrogen included, offer resistance to the passage of rays of heat, and the more extended they are, the greater is this resistance.

9. Of all gases, atmospheric air or its constituents conduct heat most perfectly.

10. The passage of heat is different according to the source from which it comes. The rays emitted by boiling water exhibit the greatest differences in their passage through different gases.

11. Of all colorless gases, ammonia transmits the least heat; after this olefiant gas.

12. By the application of a tube, the action of the rays of heat can be increased like that of rays of light.

13. The character of the walls of the containing vessel changes the proportion in which rays of heat pass through the gases contained in the tube.

14. The character of the walls also changes the proportion in which the rays pass through different gases.

15. From this, it follows, that rays reflected from different surfaces are transmitted by gases, with different degrees of facility.

16. Hydrogen always transmits rays from different sources of heat, less easily than atmospheric air.

17. The marked increase in temperature which a thermometer placed in hydrogen undergoes when the gas is heated from above, does not therefore depend upon a greater capacity of transmission but only on a greater conducting power.

18. The greater conducting power of hydrogen for heat presents a new argument in favor of the analogy of this substance to the metals.

19. Hydrogen also conducts electricity better than the other gases.

2. *On a new Unit of Electrical Resistance.*—MATTIENSEN proposes to employ as a unit of resistance in electrical measurements, the resistance of a wire composed of two parts by weight of gold and one part of silver, having a length of one meter and a thickness of one millimeter. The author shows that this alloy conducts electricity with almost equal facility at different temperatures between 0 degrees and 100 degrees, that small quantities of impurities do not sensibly affect its conducting power, and that the annealing of the metal is also without sensible influence. The memoir contains empirical formulas by which the small differences in conducting power occasioned by variations in temperature may be taken into account. The standard wire should be varnished to protect it from the action of mercury.

Note.—It remains to be seen if the proposed alloy retains its specific conducting power after it has been frequently used. It is well known that wires of copper undergo great changes in this respect.

3. *On Spectral Observations.*—MOUSSON has described a simple arrangement of a prism for exhibiting the fixed lines in spectra from different sources; the author terms this apparatus a spectrocope. A description of the apparatus is prefaced by a mathematical investigation of the conditions which are necessary for the production of a perfectly distinct spectrum, for which however we must refer to the original paper. The apparatus itself consists essentially of a tube blackened internally, and having at one extremity a plate of metal, with an adjustable slit for the admission of light. The prism is placed at the other extremity of the tube, so that the eye of the observer may be brought close to its second refracting surface. The tube is attached to an appropriate stand, so that it may be conveniently directed to the light to be examined, and the eye of the observer is protected from extraneous light by a small screen of metal attached to the tube. The edges of the slit must be ground perfectly true.

This apparatus does not require a darkened chamber or delicate and difficult adjustments. It answers equally well for observations on the solar spectrum, on the absorption lines of liquids and gases, on the electric spectra of Masson and Plucker, and on the chemical lines of Kirchhoff and Buusen.

Note.—This apparatus is constructed in New York by Mr. Charles Sucher, under my direction, the prism being supplied by Mr. Henry Fitz, the well-known optician. The price of the instrument complete with an equilateral flint glass prism, is \$25.

4. *On the Absorption and Radiation of Heat by Gases and Vapors, and on the Physical connection of Radiation, Absorption and Conduction.*—TYNDALL has communicated an important and interesting paper on the absorption and radiation of gases which is in some respects complementary to that of Magnus noticed above. The apparatus employed consisted of 1. a copper cube with one of its faces covered with lampblack and filled with water kept boiling. This forms the source of radiant heat; 2. of a brass tube 24 inches in diameter and divided into two compartments, *a* and *b*. The portion *a* is destined to receive the gases and vapors; it is closed at its two extremities by two transparent plates of rock salt and communicates with a good air pump; its length is four feet; *B* is the chamber between the tube *a* and the cube *C*. A vacuum is kept in this tube, so that the radiant heat traverses the vacuum, before entering the tube *a*. To prevent the transmission of heat by metallic conduction from the cube *C*, to the tube *a*, the chamber *b* is partly surrounded with an annular space in which cold water circulates. 3. Of a thermo-electric pile furnished with two conical reflectors, and connected with a galvanometer; one face of the pile receives the rays which have traversed the tube *a*. 4. Of a second cube *C* also filled with boiling water and the rays from which fall upon the second face of the pile. Between the cube *C* and the adjacent surface of the pile, a screen is placed, which may be moved backward and forward, so as to make the two sources of heat exactly neutralize each other. A vacuum is then made in the tube *a*, and the chamber *b*, and the needle of the galvanometer is brought exactly to 0 by means of the screen. The gas or vapor to be experimented upon is then introduced into the tube *a*; if it possess a sensible power of absorption, it will destroy the equilibrium previously existing. The deviation of the galvanometer properly reduced gives the measure of the absorption.

In this manner the author experimented with eight gases and 13 vapors, and also with atmospheric air. Oxygen, nitrogen, hydrogen and atmospheric air absorb respectively about 0.3 per cent of the rays of heat; this was the feeblest action observed. The strongest action is that of olefiant gas, which under a tension of one atmosphere absorbs 81 per cent of the calorific rays. Between these two extremes must be placed oxyd of carbon, carbonic acid, protoxyd of nitrogen, and sulphuric acid.

Below a certain tension which varies with different gases, the quantity of heat absorbed is exactly proportioned to the density of the gas. Above this tension, the rays on which the principal power of absorption is exerted, are gradually extinguished so that each increase of density produces a less effect. In the case of olefiant gas for instance, by taking a volume of 1-50th of a cubic inch as unity in a series of fifteen of these volumes, an absorption was obtained exactly proportioned to the quantity of gas; then the relations of the successive absorptions gradually approach an equality.

In the case of vapors, the most energetic action is that of sulphuric ether; the least energetic is that of bi-sulphid of carbon. By comparing small volumes and equal tensions, the absorption of the vapor of sulphuric ether is ten times greater than that of olefiant gas, and 10,000 times greater than that of hydrogen, oxygen, etc. In a fine day in Nov., the aqueous vapor in the atmosphere produced 15 times the absorption of the air itself. This great absorbing power is exerted upon rays coming from a source of low temperature, whence we must conclude that the aqueous vapor in the atmosphere must powerfully intercept the rays which tend to pass from the earth into the planetary spaces. Variations in the quantity of vapor in the atmosphere would therefore necessarily produce corresponding variations in climate. Oxygen obtained by the electrolysis of water has a power of absorption four times greater than the same substance which has been passed through iodid of potassium. This increase is due to the presence of ozone.

The author studied the radiation of gases by making them pass over a sphere of heated metal from which they rose in a column in front of the thermo electric pile. In this manner it was found that the order of radiation is exactly the same as that of absorption.

This reciprocity of absorption and radiation appears to the author a simple mechanical consequence of the theory of an ether; but why has one molecule so great and another so feeble a power of producing or arresting calorific rays? The author suggests that the explanation is to be found in the fact that the gaseous elements examined all exhibit radiations and absorptions which are excessively feeble when compared with those of compound gases. In the first case, the action is produced by oscillating simple atoms—in the second place, by oscillating systems of atoms. Thus oxygen and hydrogen, which taken separately or mechanically united produce an effect which is scarcely sensible, when they are chemically united to form oscillating systems of aqueous vapor, are able to produce a great effect.

In like manner, nitrogen and hydrogen which produce little effect when they are separated, exert an enormous action when they are combined to form ammonia. The same relation exists between the absorbing and radiating powers of other simple gases and their compounds.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SOLE and American Patent Agency of Messrs. Mun & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interests of inventors

COUNSELLOR & AGENT IN APPLICATION

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing to the Commissioner, no additional fee will be required. In cases of interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

ap25

CHARLES MASON.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, NOVEMBER 9 1861.

NO 8.

UNITED STATES COURT BUILDING.

We present herewith the new United States Court Rooms, most eligibly situated on the Southwest corner of Montgomery and Jackson streets. This handsome edifice covers an area of 107 by 137 ft.—two stories high and an attic—of modern style and architecture. The first story being partitioned for stores, of which there are seven spacious, best lighted, most centrally located for business purposes, in this city. The second story is entirely occupied by the United States authorities—comprising the U. S. District and Circuit Courts, the Marshall, the District Attorneys, Clerks, etc. Before giving a minute detail of the Court Halls, we wish to remark that the arrangements of these premises reflect great credit upon the proprietor, Mr. Platt, and the architect, Mr. Hyatt, who have seemingly spared no expense in providing every apartment with every convenience. It is by far the best ventilated building in this city. Water and gas-fittings, with all its recent improvements are judiciously placed in every room or store.

As will be seen in the cut, a main hall way, handsomely arched, ten feet in width, leads to the court rooms from Montgomery street, and also another entrance from Jackson street. In ascending the main hall way to the court rooms, we find to the right three splendidly furnished apartments, fronting on Montgomery street, occupied by the Hon. J. L. McKim, further on the District Attorney, Mr. Sharp's rooms, of the same style—also three apartments: next to these are the rooms of the United States Commissioner and Clerk, Mr. Chevers, all of which front on Jackson street. In the clerks' office we notice a safe specially erected for the reception of the papers and documents belonging to this district. The vault is impregnable, leading from the ground upwards, having double iron shutters, is spacious, and took 45,000 bricks to complete the same. Here we beheld for the first time (which reminded us of Exeter and Westminster) the thousand and one sheepskin documents, involving millions of dollars worth of property, estates, etc. The whole of this vault is lined with zinc, to prevent dampness. To the left of the hall way are two splendidly arranged apartments for the Hon. Judge McAllister, fronting on Montgomery street: next to these are the offices of the United States Marshall, Hon. Wm. Rahe (who we may assert has exercised considerable of his judgement in the placement and in arranging the situation of each department), then follow the offices of the Circuit Clerk, of Mr. Cutler & McAllister, then rooms for the porters and jury rooms. In every department we noticed on the fenders and other furniture some handsome Union device; every floor is laid with a costly Brussels carpet, and the furniture is made by Conrad of this city—of rose-wood and Mahogany, in a most substantial manner. Space forbid us to extend a synopsis or description of the court rooms, which are by far the most interesting features connected with these premises, which will appear in our next issue. We tender Mr. Platt, the owner, our thanks for taking us through the building.

A POTATO DIGGER.—The Santa Rosa Democrat remarks Thomas Lake of Sacramento has invented a machine for digging and sacking potatoes. It is twelve feet in length, and has a seat in front for the driver, within reach of which is a crank by which he can readily raise or lower a sort of plow attached, at pleasure, according to the nature of the surface or soil. The plow which is scoop-shaped, introduces the earth and potatoes to an elevated wheel furnished with a series of perforated buckets, the inner rim of the wheel also being perforated for sifting the dirt. From the wheel the residue is conducted to a shaking sieve, and thence into the sacking apparatus at the back part of the machine, below which is a platform on which a man can stand and sack. In the sacking apparatus are two valves so adjusted that they can be opened or shut by the sacker at pleasure, and above which is a rack for empty sacks within his reach. The machine can fill two sacks at the same time, and enable the sacker to sew them up and throw them off, while the succeeding sacks are filling. It is claimed that this machine will dig and sack one thousand five hundred to two thousand bushels of potatoes, or from three thousand to four thousand bushels of onions, daily, without cutting or bruising, but is designed to operate in dry soil only.

SULPHUR AS A DENTIFRICE.—Dr. C. W. Wright states in an article on the above subject, in the *Louisville Medical Gazette*, that the common flowers of sulphur of the drug-store possesses advantages over all other substances on account of its antiseptic properties, its exerting no injurious action on the teeth either chemically or mechanically, and its ready preparation and cheapness. The sublimed sulphur must be freed from any acid it may contain by agitating it in water in which a small quantity of carbonate of soda has been dissolved, and then freed from the soda by repeated washing in cold water.

Treatment of Pyrite Ores.

A patent has been taken out in England by J. Longmaid, for treating pyrites and other ores as follows:

The ores are first ground so as to pass through a sieve, having about one hundred holes to the square inch. They are then introduced into a furnace where two processes are being constantly carried on with the same heat. The first part of the process consists in the calcining of the pyrites, so as to reduce the sulphur in them to about five per cent.; and secondly, the decomposing of these calcined ores by common salt. The ground ores, when first placed in a chamber of the furnace, evolve sulphurous acid, which passes off into another chamber, where it is converted into sulphuric acid by being brought in contact with a proper quantity of oxygen. These calcined ores are now withdrawn, mixed with about five per cent. of common salt, then placed in another chamber of the furnace where they are reduced. After this they are smelted to obtain either the iron, copper, silver or tin which may be in them.

—:—:—
The ordinary rate of speed per second is as follows: Of a man walking, six feet; of a good horse in harness, twelve feet; of a reindeer in a sled on the ice, twenty-four feet; of a race horse seventy-two; of a hare, locomotive or hurricane, eighty-four feet; of sound, 1092 feet; of the earth's rotation at the equator, 1522 feet; of the earth's velocity in its orbit, 96,132 feet or nineteen miles.

On the Solution of Ice in Inland Waters.

In a paper read before the American Association for 1860, by Mr. B. F. Harrison, a theory to account for the sudden disappearance of ice in inland waters was presented, which was based upon a series of observations made upon a little lake in Connecticut, which is so hedged in that only the south and southwest winds blow upon it. It is not fed by any large stream, and has a small outlet. On the twenty-third of January, 1860, he visited the lake, and found the ice ten or eleven inches thick. He found, at a station on the lake, the temperature of the water directly under the ice to be thirty-four degrees; three feet down, thirty-eight; twelve feet, forty-one; the bottom of the lake, forty-three and a half; mean temperature, thirty-eight and seven-eighths. On the sixth of March he found the ice disappearing rapidly, as much as one-third disappearing during the two hours he remained by the lake. The mean temperature of the lake on this date was forty-one and a half. The conclusion arrived at was, that the solution of the ice is caused by heating up the water from the bottom, since the warmth could not have been communicated from the atmosphere, its temperature being lower than the water. The mean temperature of the earth at a depth of twenty feet furnishes a vast magazine of heat, that immediately effective as soon as the cold from the atmosphere ceases to be intense.

COAL-OIL AS A PRESERVATIVE FOR SODIUM AND POTASSIUM.—Coal-oil is a better article for preserving sodium and potassium than naphtha. In coal-oil, sodium keeps its lustre for months or years, while in the purest naphtha loses it in a few days.—*Cor. Jor. Franklin Inst.*

Pike's Peak Gold Region.

The total population at this time between the thirty eighth and forty-first parallels of latitude and between the one hundred and fifth and one hundred and seventh west longitude, is about 31,000 inhabitants, permanently located as farmers, miners, machanicans and traders or rancheros. Upon the different streams—that is from Cache La Poudre to the Hurfane, Greenhorn and Arkansas—there are now taken up for farming alone, more than two hundred and seventy-five thousand acres of arable land, that can produce, and do already to some extent, corn, wheat, barley, potatoes, oats, turnips, and every kind of vegetable in profusion, and of most superior quality—barley and oats producing from twenty-five to forty-five bushels per acre; wheat as much or even more. As a grazing country the grass excels in nutriment and in abundance that of any part of the continent. Timber, though scarce in the low land or prairie country, is abundant in the mountains; we have besides coal field on the eastern slope, thirty miles long, that is, from near St. Vrain river to the divide near the South Platte, the coal cropping out in some places nine feet thick. Bog iron ore, hematite and magnetic iron also abound, as well as good clay, alabaster, limestone and gypsum, in the low foot hills of the eastern side of the mountain range. The South Park, from its great altitude, is one of the finest grazing meadows of the world; the Middle Park, beside its gold, silver and lead mines, also produces an excellent quality of coal, and superior salt springs. As a cattle producing country it has no superior on the continent; its butter and milk vie with the best of Switzerland in quality and richness. The climate of the South Platte Valley, and of the mountain region is mild and regular, and from its altitude very dry and of surprising purity.

The mining region now embraces an extent of country about twenty-one or twenty-five miles in extent, with a population of about 5,500; that is the Clear Creek or Gregory's mining region. The Arkansas mines have about two thousand inhabitants; the South Park mines, one thousand two hundred; and the Middle Park or Blue River Mines, some five hundred, who remain during the winter, which is not favorable to mining in the last two regions. The Boulder mines some eight hundred more, the rest of the population being in the valleys and towns at the foot of the mountain range. In the quartz mining region there are at this time put up and in operation the following number of quartz stamping mills of different kinds, viz: ninety-two steam mills of from four to twenty-five stamps each; fifty-four water mills of from three to twelve stamps each; forty rastras or Mexican quartz mills driven by water, oxen, mules or horses; each mill being able to produce seventy-five dollars to \$1.10 per day of retorted gold, worth from fourteen dollars to sixteen dollars twenty-five cents per ounce; each rastra from twenty-five dollars to sixty dollars per day. In the mountains and in the valleys there are from thirty to thirty-five team and water saw mills, sawing from 300 to six thousand feet of lumber per day.

Manufacture of Pottery in Jersey City.

At a meeting of the Polytechnic Institute of New York, Mr. Rouse, a practical manufacturer of Jersey City, said that all the materials except flint can be had as good in this country as in Europe. In crockery ware out of thirty-two parts, twenty-two parts are the blue-ball clay, or Jersey clay, or common white clay. This comes, a large part of it, from Woodbridge, near Perth Amboy, N. J.

Most of our table ware is imported, not more than one-thousandth part being made in this country. And it has been but a few years since the American manufacture has been successful. But now that flint and borax are admitted duty free, we can compete successfully with Staffordshire. The flint is imported, ground at less than a cent per pound; whereas they could not grind it in this country at less than two cents. The cost of transportation from Staffordshire to Liverpool, and then from Liverpool to New York, the former being greater than the latter, was such that we could undersell the imported ware. Every manufacturer has his own secret in mixing the materials, and more particularly in the glazing. Thousands of dollars are sometimes lost from an improper proportion. For instance, if one of the materials is not ground so finely as another, when they are passed through the lawn, or bolting cloth, an undue proportion of it may be excluded, and thus spoil the whole batch. It cannot be detected until the work is finished; when it may all fly to pieces in glazing. All the porous cups used in Canada and in the United States for batteries are manufactured in Jersey City.

SLUCE THIEF CAUGHT.—Since their sluice was robbed some two weeks ago, Messrs. Tabor & Co. have been on the lookout to discover the thief, without letting one of the company (a Cornish miner, who had recently purchased an interest) know of the fact. The result of this was that on Wednesday night the Cornishman was detected in the act of robbing the boxes again, and was fired upon by those on the watch but escaped unhurt and a short time afterwards was found in his cabin. The miners held a meeting next day, when they allowed him five days to settle up his business and leave the neighborhood.

ON THE NATURAL DISSEMINATION OF GOLD.—Mr. Eckfeldt, the principal assayer of the U. S. Mint at Philadelphia, has lately made several interesting examinations, tending to show the very wide distribution of gold. Passing over the evidence respecting its presence in various galenas, in metallic lead, copper, silver, antimony, &c., we cite the following:—perhaps the most curious result of all.

Underneath the paved city of Philadelphia there lies a deposit of clay, whose area, by a probable estimate, would measure over three miles square, enabling us to figure out the convenient sum of ten square miles. The average depth is believed to be not less than fifteen feet. The inquiry was started whether gold was diffused in this earthy bed. From a central locality which afford a fair assay for the whole, the cellar of the new market house, in Market street near Eleventh street, we dug out some of the clay at a depth of fourteen feet, where it could have been an artificial deposit. The weight of one hundred and thirty grammes was dried and duly treated, and yielded one-eighth of a milligramme of gold; a very decided quantity on a fine assay balance.

It was afterwards ascertained that the clay in its natural moisture loses about fifteen per cent. by drying. So that as it lies in the ground, the clay contains one part gold in 1,224,000.

This experiment was repeated upon clay taken from a brickyard in the suburbs of the city, with nearly the same result.

In order to calculate with some accuracy the value of this body of wealth, we cut out blocks of the clay, and found that on an average, a cubic foot as it lies in the ground, weighs one hundred and twenty pounds, as near as may be; making the specific gravity 1.92. The assay gives seventieths of a grain, say three cents' worth of gold to the cubic foot. Assuming the date already given, we get 4,180 millions of cubic feet of clay under our streets and houses, in which securely lies one hundred and twenty-six millions of dollars. And if, as is pretty certain, the corporate limits of the city would afford eight times this bulk of clay, we have more gold than has yet been brought according to the statistics, from California and Australia.

It is also apparent that every time a cartload of clay was hauled out of a cellar enough gold goes with it to pay for the carting. And if the bricks which front our houses could have brought to their surface, in the form of gold-leaf, the amount of gold which they contain, we should have the glittering show of two square inches on every brick.

Earthquake on the Island of Penang.

(In a letter to the editors, dated U. S. Naval Observatory Washington, 24th August, 1861.)—

Gentlemen—Mr. George E. Tayler, who has just returned from the East Indies, communicates to me the following:—Feb. 16, 1861.—At half past seven p. m., there was a severe earthquake shock, of sufficient force to throw down crockery, stop clocks, and set articles to swinging. In walking the ground seemed to undulate sufficiently to make many persons feel nausea. There appeared to be three distinct shocks, each of which seemed to pass from North to South and to continue thirty seconds.

March 2nd.—I have learnt since the above, that the shock was felt at Malacca and Singapore, at the same time at each place, and with about the same degree of violence, though it was not recognized by many vessels in the harbors and on the passage here from Singapore.

About five minutes before the shock, there was an unusual commotion in the sea and I spoke of it to others at the time. There was no perceptible air stirring, and the sky was clear Thermometer 91 degrees Fahr. No other earthquake has been known here during the last seventeen years, and then only a very slight one.

Very respectfully yours

J. M. GILLISS, Supt.

EARTHQUAKE AT SYRACUSE, NEW YORK.—The Syracuse Standard of July 12, says: We learn from various sources that a very sensible shock of an earthquake was felt in this city and other parts of the county, last evening about nine o'clock. The weather yesterday very suddenly became quite cold and chilly, and extraordinary change from the intense heat of the previous days. The shock was about four seconds in duration, and was so severe as to cause dwelling houses to rock, and in some cases furniture was removed, and persons sitting in chairs were wowed to and fro. Many persons supposed that some of the fixtures of their dwellings had fallen upon the floors. A gentleman from the north part of the town of Salina informs us that the shock was sensibly felt in that section, and farmers ran out of doors supposing that their barns or outhouses had fallen.

CHROME MINES OF CHESTER COUNTY, PA.—These mines are commonly known as Woods Chrome banks or Woods pit, and are owned by Mr. Isaac Tyson of Baltimore. A large amount of ore is yearly mined and shipped from here to Baltimore, where a part of it is used in the manufacture of bichromate of potash; a salt much used for dyeing and calico printing. The mines are now about three hundred feet deep, and from seventy to eighty hands were employed there last summer.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of a convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—(Morning Call.

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its Character: and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—(Ilerald.

THE MINER'S COMPANION AND GUIDE.—In a recent notice of this invaluable work, we omitted to give some of its leading features of interest and value specially designed for our mining community and metallurgists. This book has been carefully prepared and published by the enterprising editor of the "Mining and Scientific Press," of San Francisco. It contains nearly one hundred fine illustrations, with three hundred pages of interesting and instructive matter, forming a neat little volume substantially bound, at the low price of two dollars. It is thus far the best mining work issued on this coast, having complete treatise on veins and lodes, timbering of mines, manual of metallurgy, the geology of California, and the most important of all, many new and interesting methods for separating gold and silver ores, and pyrites, together with a glossary of technical terms not contained in any other work. The number of this work will find this an indispensable hand-book. Every Californian should possess it.—(Sac. Bee.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins, and the manner in which the ore or rock is taken out. The second chapter, of 29 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Earth's rugged soil its hidden treasures.—[Union Temperance Journal.

A VALUABLE WORK FOR THE MINER.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Earth's rugged soil its hidden treasures.—[Union Temperance Journal.

SALES MINING STOCKS.

(Revised and corrected every week.)

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
 Central, \$625 per share.
 Ophir, \$1000 per share.
 Gould & Curry, \$225 per share.
 Chollar, \$15 per share.
 Lacerne, \$20 per foot.
 St. Louis, \$4 per foot.
 Mount Davidson, \$60 per share.
 Mark Anthony, \$8 per foot.
 Louise, \$18 per share.
 Bradley, \$5 per foot.
 Sacramento, \$10.
 Shelton Co., \$3 per foot.
 Josephine, Flowery, \$10.
 West Branch, Flowery, \$7.
 Harrison, Flowery, \$12.
 Yellow Jacket, \$25.
 Exchange, East Comstock, \$40.
 Monte Cristo, \$5.
 Home Ticket, \$5.
 Silver Mound, \$35.
 Sunshine, \$16.
 Ohio and Buckeye Co. Argentino, \$12.
 Chimney rock, \$15.
 Dargen, \$10.
 Rich Co., \$3.
 Miller, \$12.
 Augusta, \$6.
 Spanish Co. Plymouth Ledge, \$6.
 Chelsea, \$8.
 Caney Ledge, \$25.
 King Charles, at Flowry, \$6.
 Edgar Co. Great Western Ledge, Helena, \$20.

Number of Shares to the Foot.
 Central, 12; issue, \$300 per share.
 Ophir, 12; issue, \$300 per share.
 Gould & Curry, 4; issue, \$500 per share.
 Chollar, 4; issue, \$300 per share.
 Lacerne, 1; issue, \$500 per share.
 Mount Davidson, 4; issue, \$200 per share.
 [Having completed all the requisite arrangements we lay before our readers a reliable list of prices of mining stocks of Utah.]

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING.

...BUT THE BEST FOR...

MANUFACTURING CLOTHING

...AND...

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Casimers and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them can not be surpassed.

Various styles of Machines have been employed on the above materials but the Wheeler & Wilson is preferred.

DONALD McLENNAN,

Proprietor of the Mission Woolen Mills

y o

A. ROMAN & CO.

Booksellers, Importers, Publishers,

507 MONTGOMERY STREET,

SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 360 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc., Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Rudimentary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lam-burn.

The Discovery and Geognosy of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Disquisition on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supersede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get damaged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silver-smith, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Cain Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

Yours, truly,
 G. W. HAMMETT, A. BALDWIN,
 M. CROKER, CHARLES MCARRON,
 D. R. MEACHAM.

June 12th, 1860.

MR. STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harney's field, and I am pleased with its performance. The cam wheel power over that of the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging, bearings and boxing, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,
 ELAM BROWN.
 PACIFIC, June 23, 1860.

MR. STANDISH—Sir: This is to certify that I have operated one of your mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife in clover, or cut any grass.

Witness: Washington A. Wilson, W. T. Hendrick.
 LAFAYETTE, June 27th, 1860.

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. Further particulars at the office of the PRESS. np19

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved
 AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First Street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....NOV. 9, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansone sts., by

J. SILVERSMITH, Editor and Proprietor,

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEROTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C. is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr. Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

The Production of Metals from ores.

We may have the rich mines, and able engineers to work the same, but we lack an efficient and sure process or mode for extracting metals from their ores. A great many embark in the reported rich claims, without having the first principle of lithology, chemistry or any of the requisites by which they might obtain one ounce of metal contained therein.

Such circumstances have heretofore pervaded our mines, and will continue to do so for some time to come, till such will have discovered that they are *de facto* incapable, or expended all their means; and we fear, moreover, that little will be done in this branch of science, comparatively speaking till this abuse is abrogated.

We have now some five or six different "new processes" for treating ores; each one claiming to be the most efficacious. Many companies in Washoe, Esmeralda, California and Mexico, have been induced to buy their machines, and work with the same; in many cases they have lost more amalgam than is saved in precious metals, and here the dupe is exposed and the Mexican or Patio process recourse is had to. But the evil does not rest here; a company will erect extensive machinery both for reducing and the separation of ores from their metals, lacking, however, the most material point—a capable person who has had experience in dressing, roasting and testing the ores previous to working such, before the smelting or amal-

gamation thereof is to be proceeded with. (This, and in the manner of working mines requires experienced engineers to direct the miners is synonymous.)

We would like to recur to the manner in which companies are started with *no* capital and with millions of dollars of stocks issued, but shall only confine ourselves to the present subject. Many of our shareholders or mine owners are perhaps not aware that a metallurgist is the most essential requisite in their operations; he is not only acquainted with mineralogy but chemistry, assaying, machinery etc., if he has been to a regular institute for such purposes. Much depends upon the proper mode of roasting the ores and the testing of the same from time to time. Would it then, not be a wise plan for the many companies and associations already in existence to establish an institute, while we are yet in the infancy of our mineral developments?

Mining Companies and Associations.

In an article recently published in this journal, we made a proposition to mining companies and associations, wherein we proffered the columns of the PRESS for the publication of their Constitution and By Laws, notices, etc., for merely their aid of subscription of from three to five copies per annum.

The PRESS has an extensive circulation in the Atlantic States and England, from whence we shall eventually receive the bulk of material, either in scientific aid or capital for the successful prosecution of our mining operations. We notice in mining journals of Germany, Australia, England and France, having the publication of such rules and regulations pertaining to their gigantic enterprises. The effect it will have (of such publications) in our State would materially benefit our share owners.

Besides this, they will further the *medium*—the MINING AND SCIENTIFIC PRESS, which has heretofore devoted all of its energy and influence to the mining interest on this coast, and points out the true methods or procedure in all cases and in every particular.

Thus far our mining community, more especially extensive mining associations have given us but little patronage for our endeavors, we therefore urge them to furnish us with such matters as will aid us in the prosecution of our Mining journal and further their own interests at home and abroad.

Fine Minerals.

MR. BENNETT formerly Editor of the Columbia Times, paid us a visit a few days since. He exhibited to us nearly forty beautiful specimens of rare minerals all of which were collected by him. It is his intention to send a part of them, or of such of which he possesses duplicates to the World's Fair at London in 1862.

There were specimens of zinc, strongly resembling galena, nickel, alabaster, asbestos, obtained near Saw Mill Flat, a most rare mineral and a perfect specimen; gold crystals; silver from half a dozen veins in Washoe and also from Tuolumne; lazulite of copper; kyanite; purple spar; gypsum; gold in limestone matrix, a rare specimen; a variety of copper ores, with specimens of native copper from Washoe; also specimens of the coal found in the newly discovered coal mine, in Carson Valley.

United States Branch Mint.

DR. MUNSON, formerly assistant assayer, has been appointed chief assayer in place of Mr. Wiegand.

Ozone as a Means of Restoring Old and Faded Engravings, etc.

According to W. Gorup-Besanez, ozone when properly applied is a most effective and convenient agent for restoring books or prints which have become brown by age, or been soiled or smeared with coloring matter; only a short time being required to render them perfectly white, as if just from the press, and this without injuring in the least the blackness of the printer's ink or the lines of crayon drawings.

As examples of his results the author mentions a book of the sixteenth century upon a page of which several sentences had been painted over, by the monks of that epoch, with a black, shining coloring matter in order to render them illegible, and of which no trace of a line could be detected. After 36 hours treatment with ozone the coloring matter was entirely destroyed, and the most careful scrutiny of the page would have failed to discover that any of the lines had once been painted over. In like manner a wood cut of Durer

which had been besmeared with a dark yellow color was completely restored.

Writing ink may be readily discharged by ozone, especially if the paper be subsequently treated with very dilute chlorhydric acid to remove the oxyd of iron.

Printer's ink is not attacked by ozone to any appreciable extent unless the action be long continued. Vegetable coloring matters are completely removed by it, but metallic coloring matters, grease spots and stains produced by fungi cannot thus be destroyed.

As applied in the small way, the method consists in placing a bit of phosphorus about 3 inches in length and $\frac{1}{2}$ an inch in diameter, the surface of which has been scraped bright, in a wide necked glass carboy, or other large hollow vessel, pouring in as much water, at about 30 degrees (C.), as will half cover the phosphorus, closing the vessel with a cork, and allowing the whole to stand until the jar is charged as strongly as possible with ozone, which ordinarily occurs after 12 or 18 hours. Then without removing the phosphorus or water, the paper to be bleached, which has been moistened with water, rolled up, and fastened to a platinum wire in a suitable manner, is hung in the middle of the vessel. The cork is now restored and the apparatus left to itself. The roll of paper is soon surrounded with the fumes arising from the phosphorus and the stains gradually disappear. The rapidity of the operation of course depends upon the nature of the substance to be discharged—three days having been the longest time required in any of the experiments. Prints which had merely become brown by age and those stained with coffee usually become perfectly white and clean in the course of 48 hours. The action of the ozone however must not be continued too long lest some of the finer lines of the engraving should be injured. After all the spots have disappeared, the paper is strongly acid and if allowed to dry when in this condition would become exceedingly brittle and also dark colored. It is consequently necessary to remove the acid completely. In order to accomplish this the paper is placed in water which is frequently renewed and allowed to lie there until a bit of blue litmus paper pressed against it is no longer reddened. The paper is then passed through water to which a few drops of a solution of soda have been added and is spread upon a glass plate, this is slightly inclined and a fine stream of water is allowed to flow over the paper during 24 hours. After the paper, on exposure to the air, has become dry enough to remove from the glass without danger of tearing, it is taken off and pressed dry between folds of filter paper.

The author remarks that in case the process were attempted on a larger scale it would probably be well to have glass troughs or boxes blown of the desired form, since it is not easy to prepare suitable vessels by any process of fastening together pieces of glass, the cement being attacked by ozone.

Attempts to apply ozone in restoring oil paintings gave only negative results, the action having been irregular.

Chromo-Typography.

M. Rochette has devised a new method of printing in different colors used in this art. Instead of applying a series of plates or stones, each bearing one color, in the usual way, he arranges his plates upon a rotating platform, of smaller dimensions, but like those used on railways. Suppose four plates thus arranged with black, red, blue, and green, and a sheet of four pages, which it is desired to print, imposed upon them. One page will be printed in each color, and by turning the sheet a quarter round each time, the remaining colors will be printed in succession. This apparatus has a mechanical contrivance to ensure accuracy of position; and, as the colors admit of super-position, green may be formed by successive printings yellow and blue, orange by yellow and red, etc.

GAS-LIME AS A DEPILOYATORY.—As is well known, the Turkish *rusma* owes its action on the hair to the persulphide of lime it contains, the arsenic present being only the bearer of the sulphur. A writer in the *Polytechnische Central-Halle* gives the following as the rationale of the process now in use by the tanners with the gas-lime. The depilatory action depends exclusively upon the persulphide of lime and is heightened by the presence of cyanide of calcium. Pieces of hairy skin brought into a mixture of two compounds were at once deprived of hair, the destruction commencing on the ends and stopping at the root without acting in the least on the skin. It appears that one atom of sulphur combines with the substance of the hair, destroying it, and at the same time leaving an insoluble sulphate of lime which is precipitated together with the decomposed hair.—*Druggists' Circular*.

CHLORINATED WATER IN DISSECTION WOUNDS.—M. Garrigon states that repeated experience has convinced him of the efficacy of the treatment long since recommended by M. Nonant, of placing the hand suffering from dissection wounds in chlorinated water. The application will always be found efficacious, providing purulent infection have not already set in, when it will be useless.—*Gaz. des Hop.*, 1859, No. 30.

ACTION OF SULPHURETTED HYDROGEN ON SILVER.—It has been shown by MM. Davanne and Girard that perfectly dry sulphuretted hydrogen does not act upon silver. Silver leaves may be suspended in a perfectly dry atmosphere of this gas without undergoing change.

MINING AND SCIENTIFIC PRESS.

To Miners and Mill Owners.

respectfully request all persons interested in the Mines, Quartz Mills, or in any prospecting expedition; also the owners of the different mining districts to forward to us, in the form of a letter, such information concerning the condition of the mines and hills in their vicinity, and description of the same, as they may think will prove interesting or useful to the public, for publication. Records of mining districts are kept by sending us their address.

CALIFORNIA.

Delta County.—The Delta furnish the following items of news for the community: It is occasionally passing through this place, a telegraph company, detained some time in this place is going on, now half way to its destination. The machinery of Messrs. Hittinger arrived here a day or two since, on the way. It should be in place in twenty days. More is now on the way, which should be hurried up, as the machinery is near at hand. Great anticipations of the results of the mining of the Delta are entertained by the owners, which it is to be expected will be realized. A new discovery of gold placers has been made on and adjacent to Tule river, about twenty-five miles above Los Angeles road from this place crosses it. It is a very recent discovery, and not sufficiently developed to justify a statement regarding the richness of the region, or its richness. Two or three persons have been down last week with specimens from which it is judged that the gulches is rather coarse. Enough is known that a limited region is gold field, which may or may not be rich enough to be attractive.

Monterey County.—The following interesting notice of the New quicksilver district in the above county is taken from the enterprising *Bay Union*: When the name of the above mine is mentioned in this paper, the auditor is wont to ask where they are, as if they were located in some foreign country, in which case we are a community had no interest in which we had no kind of connection. It is in fact we should be dealing with men daily fresh from the mines, who are engaged in exporting to market the quicksilver produced. It might not be uninteresting to readers to give a few facts concerning them. These mines were discovered in the year 1854, by Mr. Jesse Smith, now in Watsonville, and J. Pitta, residing at San Juan. They are situated in Fresno county, about two miles north-east of the head of San Joaquin, which empties into the Papago river near San Juan. The latter stream forms a valley, a natural road from near the mines to San Juan. In 1855, J. Smith and Pitta leased the mines to Messrs. Daniel Gohls & Co., of San Jose, who made large expenditures and have successfully opened mines, and are manufacturing large quantities of quicksilver, which is then transported by teams under contract with Mr. Folgerman National Hotel, San Juan, via the latter place, and thence to Alviso, where it is shipped to San Francisco. From the mines to San Juan it is seventy miles, and from San Juan to Alviso, is fifty miles—making a total of one hundred and twenty miles. Now, from San Juan to the Landing, on the Elkhorn Slough, seven miles above where the Salinas empties into the Bay of Monterey, and where Messrs. Millard and J. J. Brennan have a warehouse forty by two hundred feet, with coal wharf to load vessels from, it is only about thirteen miles over a route susceptible of making as good a road as can be desired, hence the distance to this point would be about thirty-seven miles, and from this point to Alviso, seventy-four miles. This would save quite four for heavy teams that are used for hauling. We are not familiar with the difference in price between land carriage and transportation by rail, but it must be considerable, and by water the cheapest. From Alviso, the steamer *Salinas* runs regularly to San Francisco every week. Now, after reading this sketch it would not be strange if the people ask the question, why is it that Capt. Brennan and Mr. Folgerman do not make arrangements to ship the product of the quicksilver mines to the Landing? We refer every enquirer to them. If our country concerns why not develop them at once and put them to use?

San Joaquin County.—Through the politeness of Assessor McGrath we have been permitted to give some of his statistics of the county. From his report it appears that there are thirty-one quartz mills in the county, crushing a daily average, one hundred and eighty-seven tons or 68,255 tons daily. This, according to the most reliable data of which we are possessed, will yield an average of eight dollars per ton, making a total annual of little less than five and a half millions of dollars.

Fresno County.—A letter to a gentleman of Stockton, dated Miller, October 26th, gives a fine account of the mines in Fresno county, on the Joaquin river near Millerton. He says Payne, Christie, Dunn & Co., are mining two hundred dollars a day since they commenced working. On the last, this company took out three hundred and ninety-one dollars worth of ore.

Yuba County.—The Yuba Journal through its columns announces Mr. Martin Fagan, at Junction City, offers valuable mining property for sale. His claims, reserves, etc., are located near the mouth of the Cache, a rich mining locality.

Butte County.—Rich diggings have been discovered on Jackson Creek, far from the town of Jacksonville, Oregon.

Sierra County.—The Sierra Butte Company lately cleared up in one day, after a forty-three days run twenty-six thousand dollars.

NEVADA TERRITORY.

The Silver Age furnish us with the following brief history for the past few months' mining incidents of Esmeralda: It is now fourteen months since the discovery of the Esmeralda mines by Messrs. Braly, Cory and Kelly, and about one year since they were found to be rich and extensive, came to be somewhat known abroad. Being late before they were heard of in a locality remote, and then difficult of access, but few persons visited until the opening of Spring, when there was as yet, not a single person, or even an assayer, for reducing the rock, so late as the 20th of May, there was not a sign of improvement, or a note of preparation heard in these mines. How much things have been changed, the following obtained from a gentleman intimately acquainted in this district, will show. Early in June, Messrs. Green, Culver and Jackson, brought in a small mill of about fifteen horse-power, and running on a small stream of water. It was really a good mill, and in the hands of Mr. Richardson, a skilful machinist and engineer, was well put up and run handsomely. An amalgamating apparatus however, was insufficient, and it failed to save gold—rock supposed to contain from sixty to one hundred dollars to the ton, not yielding over twenty-five or thirty dollars. Great dissatisfaction was the result, and many censured Mr. Richardson very unjustly, while more or less discouraged, least the fault should prove to be in the blunder of the mill, after all. A change was then made in the amalgamator, two more assays were added, and a somewhat different mode of working adopted, when a great improvement in the yield followed, and the mill is now operating with satisfaction to both the owners and the public. The next mill put up was the Union—twenty-horse power—owned by Messrs. Green and Jackson. It runs night and day and crushes about ten tons of rock daily, yielding about eighty dollars to the ton in gold, there being no means of saving the silver attached. Then came the new mill, owned by Messrs. Young & Mill, twenty-horse power—crushing ten tons daily. Avery & Co.'s stamp, thirty-horse power, with capacity for crushing fifteen tons daily. Young's mill, twelve horse power—operating on an entirely new plan, and expected to crush fifteen or twenty tons a day—is about ready to start and almost sure to prove successful. Brodie & Co., thirty-horse power, early ready to start—is a fine mill with silver process attached. Clayton's

also a large mill, and prepared to work for the silver. Lamb's, a small mill up at the old Esmeralda camp—not running now. Rev. Henry Durand has also erected a mill, on the main Walker river below the junction which is running and doing well. Mr. Durand is Principal of the Oakland college, and having been granted a respite of one year to recuperate his health, determined to engage in quartz mining, the proceeds to go for the benefit of the institution. Besides these mills, are all by this time, most likely completed and running. There are some also erected above on the way, or about being shipped from San Francisco for these mines, and it is fair to suppose the entire number will be double in less than eight months. The rock crushed at these mills yield from fifty to one hundred dollars to the ton in gold, none of them having yet commenced to save the silver, which is known to constitute a good portion of its value. With such a beginning it is clear to see the Esmeralda district must now progress rapidly and come out equal to the most famous mining districts of the far west. The latest news from this quarter represents things as looking well, the population being somewhat on the increase and confidence in the ultimate success of the mines unabated. Not much work is being done in the claims just now, the miners being for the most part engaged building houses and making other necessary preparations for winter, of which they have already had a taste in the more elevated mining districts. As yet they have had no snow, but the frosts are cold, and the streams being covered with ice, the ground frozen to the depth of an inch or more. They build mostly with adobe—some with stone; many of the houses at Humboldt city, now numbering nearly a hundred, being large and substantial. Unionville, on the east side of the mountain has also grown into quite a town, and a considerable hamlet has sprung up in the Star District. There is a good deal of feeling in regard to the location of the county seat, the residents of Humboldt being desirous to have it there, and those in the Star district desiring to have it at Unionville. At this time the larger number of inhabitants are in and about Humboldt, which is also the most accessible point being of easy approach by means of a good wagon road from all directions. The most extensive mines, however, are over the mountains, where also, the greater number of people will ultimately be gathered. If the popular voice were left to settle the question, just now, Humboldt would probably be the place—if the prospects of the future of the inhabitants were considered, the county seat would most likely go elsewhere. The distance between Humboldt city and Unionville is not over twelve or fifteen miles—around by the wagon road it is over thirty. We were mistaken when speaking of these mines last week, in saying one or more mills were on the way from San Francisco. Partial arrangements had been made for procuring a mill but they failed to be perfected, and it is now doubtful if any can be got in this winter. With the opening of spring, however, it is expected a number of mills will be necessary appliances for reducing silver ore, will be taken up. The mines will be opened during winter and got in readiness for working. In the Star district they have not yet struck the ledge, the rock being so extremely hard that not more than three or four inches are made daily. But few cash sales are being made of mining ground at present. What trading takes place is mostly in the way of barter for other property, and in this matter there is some little traffic. The market is tolerably well supplied with good quality of wheat. With the approach of winter prices have advanced a little, but having come from twelve to fifteen dollars a bushel. The only kind of vegetables now to be had are potatoes. Butter, also, is scarce, though all kinds of fresh meat are very abundant.

From Richard Watson, formerly a resident of Carson, but for some time just living on the Humboldt, the Silver Age learns that samples of good coal have lately been found at a point some forty or fifty miles north of the mines. Mr. Watkins has twice visited the locality, and found pieces of coal of large size lying on the surface. No regular veins of coal are known, but the favorable geological indications, render it most certain that a coal bed exists at that spot. Some of the pieces procured are ten inches long, and three or four thick, weighing six or eight pounds. They have been thoroughly tested and found to burn well. Mr. Watkins is now on his way to San Francisco, where he has arranged for the necessary means to sink a shaft and make a thorough exploration of the neighborhood where this coal was found. The coal is tested, then mixed with the streaks of sulphur and slate, burn freely, answering well for blacksmiths' use.

Says the *Sierra Courier*: We have conversed with an intelligent gentleman, Capt. Weatherline, just in from the mines on the Humboldt. He gives most glowing descriptions of their extraordinary richness, and says that he has no doubt but that there will be twenty thousand people profitably employed in one year's time. Judge Harrison, formerly of this county is doing extraordinary well in the Humboldt mines. He takes along a liberal supply of grub, and intends to make his "eternal fortune" ere he returns. We learn that the gentlemen who sunk a shaft on the Elito Lode, Esmeralda, have prospected it to a depth of thirty feet, where they find a large body of very rich gold and silver bearing quartz. The Editor of the *Age* says that he was shown by Mr. Hopkins specimens of Chinaburg from the Humboldt country that yields thirty-three per cent of gold in quicksilver. The silver is of the purest quality, and is about twenty-five miles from the Elito ledge of dark colored quartz permeated by veins of this mineral. These veins are numerous, stand vertical, and are about one inch thick. The ledge has been taken up by Mr. Watkins and others who consider it valuable. The mines of Esmeralda are extensive and profitable, according to a recent correspondent, and can be worked more cheaply than those in Washoe, fuel being cheaper and the ore being more readily obtainable. A correspondent of the *Bulletin* says that the silver is of the purest quality, and is about twenty-five miles from the Elito ledge of dark colored quartz permeated by veins of this mineral. These veins are numerous, stand vertical, and are about one inch thick. The ledge has been taken up by Mr. Watkins and others who consider it valuable. The mines of Esmeralda are extensive and profitable, according to a recent correspondent, and can be worked more cheaply than those in Washoe, fuel being cheaper and the ore being more readily obtainable. A correspondent of the *Bulletin* says that the silver is of the purest quality, and is about twenty-five miles from the Elito ledge of dark colored quartz permeated by veins of this mineral. These veins are numerous, stand vertical, and are about one inch thick. The ledge has been taken up by Mr. Watkins and others who consider it valuable. The mines of Esmeralda are extensive and profitable, according to a recent correspondent, and can be worked more cheaply than those in Washoe, fuel being cheaper and the ore being more readily obtainable. A correspondent of the *Bulletin* says that the silver is of the purest quality, and is about twenty-five miles from the Elito ledge of dark colored quartz

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers. and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to deprecate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut Balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plater or runner of each set is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the Smut Balls, Oats, Chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest), and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—ad can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals,—whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. S. LIVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

Coal.

Imports from January 1st to September 15 :	
Anthracite, tons.....16,903	Sydney, tons.....11,304
Cumberland csk.....1,144	Japanese tons.....25
English, tons.....14,165	Vancouver I., tons.....4,536
Chili, tons.....9,135	Coast, tons.....11,384

The sales of 3000 tons Anthracite, to arrive, which occurred some little time since, and were not made public, are the only transactions of moment which have come to our knowledge. They were effected at \$18 @ 19 $\frac{1}{2}$ ton, with some slight resales at \$20. Our quotations give a true index of the market.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths. fine	3cts per oz.
" from 300-1000ths. to 750-1000ths. fine	7cts "
" " 750-1000ths to 950-1000ths "	14cts "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts. " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, $\frac{1}{2}$ per ct. value of silver for making bars; also when gold is contained per ct. on gross value of gold for coining. Refining charge in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be paid for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule hereafter be, that the value of gold contained in the will be paid in gold coin, and the value of silver in coin. The value of the silver will be calculated at per standard oz, and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge $\frac{1}{2}$ per cent. will be made additional. Bullion of the denomination will be entered on the gold and silver register as most congruous with the physical aspects of the metal but in the warrant it must be marked that so much is paid in gold and so much in silver, according to the tents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent R. J. Stevens.

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN'S TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. ROOM is fitted up so as to combine ELEGANCE with COMFORT. The billiard will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SECARS,

And the subscribers hope, by strict attention, to merit the patronage of who admire and practice the GAME OF BILLIARDS. DAN LYNCH, 720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and saleroom for

Phelan's Patent Combination Cushions and Modern Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claim for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, ready to give all required information with regard to the merits of the JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables.

A SPLENDID OPPORTUNITY.
AGRICULTURAL MACHINERY.
I have taken, for five years, a large portion of
the Prison Labor, for the sole purpose of manufacturing
AGRICULTURAL IMPLEMENTS AND CABINET WARE
for sale, at a Great Sacrifice, in order to close out my present stock
before First, 1861, the following articles:
EIGHT HORSE STEAM THRESHERS;
RUSSELL'S EIGHT AND TEN HORSE THRESHING MACHINES.
MILLS' GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND
TWELVE HORSE POWER, with all of C. M. Russell's Latest Im-
provements;
MACHINES, REAPERS AND MOWERS;
MACHINES for Threshing Machines and WIRE TOOTH BUGGY HORSE
WHEELS.
The above goods will be sold at the Lowest Prices, either for Cash, or
on approved paper at a low rate of interest.
THOS. OGG SHAW,

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission
and Howard, San Francisco, California.—By recent additions to
before extensive establishment, we can confidently announce to the public
that we now have
*The Best Foundry and Machine Shop on the Pacific
Coast.*

With upwards of forty-five thousand dollars worth of patterns, we are en-
abled to do work cheaper and quicker than any other establishment on this
side of the Rocky Mountains.
We make to order, and have for sale, High and Low Pressure Engines,
both Marine and Stationary; Straight Quartz Mills of all sizes and
designs; Stamp shoes and dies of iron, which is imported by us expressly
for this purpose—its peculiar hardness making shoes and dies last two or
three months. Milling Pump of all sizes and kinds; Flouring Mills; Gang,
Sash, Muley, and Circular Saw Mills; Shingle Machine, cutting 25,000 per
day, and more perfectly than any now in use. One of these shingle machines
can be seen in operation at Metcalf's mill in this city.
Knox's Amalgamators, with the latest improvements; Howland & Han-
com's Amalgamator; Gouldard's Tub, lately improved; in fact, all kinds now
in use.
Quartz Screens, of every degree of fineness, made of the best Russia Iron,
Car Wheels and Axles of all dimensions; Building Frames; Horse Powers;
Saw Mills; Boiler Frames; Wind Mills, of Hunt's, Johnson's and Lunt's Pa-
tent; and to make a long story short, we make castings and machinery of
every description whatever; also, all kinds of Brass Castings.
Steamboat work promptly attended to.
Thankful to the public for their many past favors, we would respectfully
olicit a continuance of their patronage. Before purchasing, give us a call
and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—
BRYAN'S IMPROVED MILL.
THIS MILL will Crush, with the same weight
of Stamps, Twenty-Five per cent. more rock
than any other mill yet invented. It is also
Cheaper, more Durable and run with Less
Power. All parts of it being fitted together
before leaving the shop, it can be put up
set at work Crushing the Ore, in Ten Hour
tor arriving on the ground!

Every one exclaims after seeing the Mill in
operation, "Why has not so perfect and ye
simple a mill been invented before? It would
have Saved the Fortune of many a Miner
expended in worthless machinery, and enriched
the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS
Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY
Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, } San Francisco
Union Reduction Company, }
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated
Vermont Reaper and Mower, which is unsurpassed for Simplicity, Dura-
bility, convenience and thoroughness of work.
The high estimation in which this Machine is held by those farmers who
have used it, justifies the expectation that, with the late improvements, it
will become the leading machine, when its superior qualities are generally
known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE
HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to un-
even surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in
constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving
his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed
to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently
you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter bar being hinged to the machine, can be packed up with
out removing bolt or screw.
- 8th. The cutter bar is readily raised by a lever, which is very convenient
at the corners of the land; when raised, the machine will turn as short
and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it
easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one
for mowing, the other designed expressly for reaping, which, with other
improvements, should command the attention of every farmer.
- 12th. We invite Farmers wishing a machine to call and see before purchas-
ing. **KNAPP, BURRELL & CO.,**
apd 310 (Old No. 80) Washington street, near Front, San Francisco.

New Premises of the Philadelphia Brewery

The annexed illustration presents one of our most substantial manufacturing establishments on this coast. Messrs. Hoelscher, Wieland & Co., the gentlemen proprietors have erected within the past six months these edifices, and are beautifully situated on Second street, corner of Folsom, and takes in all of the residence buildings and gardens of the late Capt. Folsom. In making a hasty reconnaissance we find that extensive machinery, new and improved appliances for expediting their extensive demand of their delightful beverage—"Lager Bier" have been introduced. We have noticed more particularly a new steam engine, of Devoe & Co.'s make, beautifully encircled by an iron railing.

Space forbids us to give a more extensive description (in this number) of this house, suffice it to say that this firm have a universal renown as skilled and faithful factors, and their beverage. It will well repay any one desiring to understand the *modus operandi* of beer brewing to visit the same. The furnaces, malt vats, immense boilers, extensive vaults, drying rooms, etc., are the largest in this State.

In another issue we shall give particulars of details, giving the capacities, extent, and quantities of their premises and statistical operations.

New Anesthetic.

During the past few months considerable interest has been excited among members of the medical profession by an attempt to introduce into practice a volatile liquid possessing anesthetic properties which is obtained as an incidental product in the manufacture of coal oil. The chemical history of this substance—called kerosene by its manufacturers, but little is as yet known. Prof. Bacon, of the Harvard Medical School, informs us "that a sample in his possession is of sp. gr. 0.640, at 72 degrees F. When heated in a flask containing scraps of platinum foil it began to boil at about 85 degrees F. As the more volatile parts distilled off, the temperature continued to rise, and at 170 degrees about three-quarters of the liquid had evaporated. It continued to boil feebly, but the whole was not converted into vapor until the thermometer had risen considerably above 300 degrees; and when the flask was allowed to cool, much of the vapor condensed before the temperature had fallen to 300 degrees. It is evident that several, perhaps many, hydrocarbons are present, having a wide range of boiling points. Probably the most volatile of them would be gaseous at ordinary temperatures, if isolated. It is remarkable that the kerosene should be so readily and completely volatile at atmospheric temperatures. I found that kerosene and Squibb's ether, exposed in watch glasses, lost equal weights in 2½ and 3½ minutes respectively; and the former evaporated completely in about two-thirds of the time required for the ether. The specimen which I examined contained a little sulphur. Some sulphur compound was therefore present as an impurity, which would be decidedly objectionable for anesthetic purposes."

The vapor of this substance possesses very decided anesthetic properties. This was first accidentally noticed by its effects upon a laborer engaged in cleaning a cistern at a coal-oil manufactory, and afterwards proved by the workmen by experiments upon flies and mice. Whether it can be employed without danger as a substitute for ether or chloroform is as yet undecided. Dr. H. J. Bigelow (Boston Medical and Surgical Journal (July 11, 1861) lxiv, 494.) reports several cases in which its exhibition was attended with unfavorable symptoms; and at the present time the general feeling of medical men in Boston with regard to its value is evidently much less favorable than when it was first brought forward. It may be remarked that the "kerosene" in question is exceedingly well purified as far as relates to its odor, being almost entirely free from the objectionable smell which characterizes most of the light coal oils.

Coal Oil.

We learn that the miners for natural coal oil are very sanguine that they have their fortune in store, in Lower Mattole valley. Maj. McCoy has a natural spring, out of which he has dipped as many as 30 gallons in one week. Prospects upon Mr. Davis' ranch, where a well is being sunk on the principle of artesian wells, are also very flattering.

There are also some other curious facts connected with this region of country, which deserve notice. Near the Mattole river are a number of escapes, out of which is constantly issuing gas, which has the peculiar smell of the manufactured article which lights all of our principal towns and cities; and when a blaze is applied, it readily ignites, and will blaze up many feet in the air. One of these escapes is in the Mattole river, near the centre; and with a torch any person who has the curiosity to try it, may do what few people have thought possible—set the river on fire. These escapes are not confined entirely to this particular neighborhood. There are a number of them on Bear river, some 15 miles north of the Mattole, and above Cape Mendocino. From these indications, we infer that there must be quite extensive gas works somewhere down below, and plenty of

material to work with. These gas works must be an improvement on any thing of the kind now in use. What a magnificent place for some future manufactory; fine timber for building, coal for fuel, oil for lubricating, and gas for lighting any amount of manufactories, right from nature's work shop.

We shall look for the arrival and examination of this interesting region by Professor Whitney with much interest. It is further removed from market than the Monte Diablo mines; but for natural richness, we think the Mattole country will far excel the former.

BENZINATED MAGNESIA FOR THE REMOVAL OF GREASE SPOTS.—Lumps of carbonate of magnesia (calcined magnesia will answer the same purpose) are saturated with benzole, and spread over the grease spot a sixth of an inch thick. When dry, the magnesia is simply dusted off, but the operation is repeated if necessary. This method of applying benzole in combination with the capillary action of the magnesia is said to be superior to any other for the removal of fresh and old spots from all kinds of wood, ivory, paper, parchment, silk, and cotton; for, woe to it is not adapted, on account of the magnesia becoming fixed in the grain.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR: VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 2d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmer and Planter will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 367, P. O.

Rooms 20 and 21, Government House, Corner of Washington and Sanson streets, San Francisco.

PHILADELPHIA BREWERY

Second street, corner of Folsom, SAN FRANCISCO.

Hoelscher, Wieland & Co. Proprietors

Thankful for past patronage to a discriminating public, we beg to apprise at the same moment our many friends and patrons that the above well known Brewery has been permanently located in our new premises, on Second street—the former residence of Capt. Folsom, where we endeavor to continue in furnishing our numerous patrons with the best of "Bier." We shall strive to perpetuate the good reputation for promptitude and the faithful execution of orders as heretofore, and by increase our custom.

GOLDEN GATE IRON FOUNDRY

No. 6 Battery Street, SAN FRANCISCO.

Particular attention paid to the MANUFACTURE

KNOX'S AMALGAMATORS, QUARTZ MACHINERY, MANTEL GRATES, STOVE WORK, CALDRONS, ETC.

We also Manufacture

IRON CASTINGS, OF ALL KINDS.

DEVOE & CO.

STEAM ENGINE AND MACHINE WORKS

Corner Market and Fremont sts., San Francisco

All kinds of machinery, such as Steam Engines, Sawmill Irons, Flour Mills, Quartz Mills, etc., etc., made to order and repaired.

—ALSO—

BLACKSMITHING,

Turning, Finishing, Planing, and Screw-Bolt Cutting.

AGRICULTURAL MACHINERY

Of all descriptions, made and repaired.

Duplicate parts of THRUSHING AND REAPING MACHINES, and TRACTOR TRAILERS, made to order on the most reasonable terms.

STEAM ENGINES AND BOILERS.

Constantly on hand, and for sale cheap.

Screw-Cutting Turning Lathes for sale.

IMPORTANT TO INVENTOR

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE Scientific American Patent Agency of Messrs. Munro & Co., and for ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interests of inventors

COUNSELLOR & AGENT IN APPLICATION

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts. 2d Story, Washington.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other documents pertaining to the obtaining of Letters Patent, will be executed for \$5. For arguing the case in the event of a re-examination, and for a fee of \$5 to the Commissioner, no additional fee will be required. In case of an appeal to the Circuit Court a reasonable extra fee will be made.

For a fee of \$5, a preliminary examination will be instituted in the Patent Office, and a reliable opinion given as to the probability of success. More than four thousand examinations of this character conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct 4 1860

Learning that R. W. Fenwick, Esq., is about to open an office in San Francisco, I cheerfully state that I have long known a gentleman of large experience in such matters, of prompt and accurate habits and of unblemished integrity. As such I commend him to the patrons of the United States.

VOL. IV.

SAN FRANCISCO, SATURDAY, NOVEMBER 16. 1861.

NO 9.

LA MINA PRIETA, SONORA, MEXICO.

The above diagram represents the splendid mining property incorporated under the style and name of "La Mina Prieta," organized in this city. This celebrated mining ground is situated within three miles of San Antonio, Sonora, Mexico. We examined some months since specimens of ore taken from this locality, and recognized it as rich antimonial-sulphuret-silver ore. The vein is three feet thick having a main streak of eighteen inches in width—extremely rich.

The following are different assays made by San Francisco Metallurgists:

July 11th. By Messrs. Bradshaw & Co.—	
One ton of 2,000 lbs. contain \$377 70-100ths silver.	
" 2,000 " " Trace of gold.	
" 2,000 " " 32,271 80 silver.	
" 2,000 " " 527 00 silver.	

July 15th. G. W. Bell, one ton 2,000 lbs., contain \$1,432 60 trace of gold.

July 16th. Kellogg, Hewsten & Co., 1228 64-100ths oz. of silver; value, \$1588 50. No gold. Nov. 8th. 493 20-100ths oz. of silver; value \$637 66; no gold.

The *Alta*, in a recent issue, remarks:

"The bulk of the ore lies on the sides of a ravine, which gives every facility for draining and renders it certain that the mine will never be abandoned in consequence of the filling with water, as has been the case with many of the old mines in Sonora. The vein is exposed along a considerable line on the hillside, and two shafts and a tunnel have been cut to take out ore and ascertain the character of the deposit. The two shafts are two hundred feet apart, and in the two places the character of the lode and ore is the same.

The mine has been opened for several years, having been worked for a time by the Mexican *gambusinos*, and lately by a couple of Cornish miners; and now the Mina Prieta company have eight Cornish miners and a large number of *peons* employed. The purpose of the com-

pany is to ship the best class ore to this city, and pile up the poorer ores near the mine, and hereafter sell or work them there. There is a wagon road from Guaymas to within fifteen miles of the mine, and those fifteen miles might be made passable for wagons with an expenditure of two or three hundred dollars. The Ynqui river is navigable for flat boats six months in the year, so the ore might be sent down to the Gulf in that way. The cost of transportation to Guaymas by mule wagon, and by steamer to San Francisco is fifty dollars per ton. Timber suitable for firewood and building is abundant near the mine, and the water, some large springs a mile and a half from the mine, and at higher elevation can be led to the place.

Capt. Chas. Lovett, who has been on this coast twelve years, and is well known as master of one of the Honolulu packets for a long time, was sent down by the company to examine the mine, and his report is so favorable that they propose to go to work energetically. They say a vein so large, rich, regular, well situated, and yielding rich rock at three openings, would be worth one thousand dollars per foot in Washoe; but as it is in Sonora, they value it now at only forty-five dollars. The company, instead of putting their stock up into the millions, have confined it to the moderate sum of \$100,000, in one hundred shares, which, it is said are not obtainable at less than par.

The above diagram is a faithful copy from an actual survey of this mine. According to the scale the hill to the left is 700 ft. high, and so to say is a mass of rich mineral as above described.

THE NEXT GREAT WORK.—The telegraph line will soon be on its way from Yreka, California, to Portland, Oregon, with the states east. The completion of the Russian project of connecting Europe with America by telegraph across Bering Straits, through Siberia, and all parts of the great nations, will probably be the next wonderful work in which all civilization is concerned.

On the Probable Compound Nature of some of the So-Called "Elements."

An interesting and elaborate paper by Gustav Tschermak, published in the Proceedings of the Academy of Science, Vienna, and extracted in an abridged form in *Knop's Centralblatt* (July 4, 1860), on the subject of the law of volumes of liquid chemical compounds, affords a support to the views expressed by Mr. Lea, of Philadelphia, and others, "that those bodies which we have as yet failed to decompose we have not found to be elementary." The author therein shows that many of the substances usually classed as elements comport themselves in the physical properties exhibited by their combinations as compound bodies, and that it is possible from these physical properties to determine (hypothetically) the number of "physical" or absolute atoms which he supposes to be contained in a chemical atom, such body or pseudo-element. He endeavors to show that it is possible to calculate the specific gravity of a liquid from its atomic weight and the number of simple (chemical) atoms in its compound molecule as data, but that the results lead to the immediate inference that each chemical atom contains, with few exceptions, several physical atoms.

The particulars of the theory of M. Tschermak, and the results deduced by him, are too technical for presentation in the present volume; but a further reference to them may be found in *Silliman's Journal* for November, 1860, in a paper communicated by M. Carey Lea, of Philadelphia, on the subject.

A BIG BLOCK OF NATIVE COPPER IN NEVADA CO.—We have frequently noticed the discovery of copper indications such as the pyrites, salts and even pure scales of the metal in the gold diggings of Lewis & Hiscox, at Buckeye Hill, near Sweetland, Nevada Co., and were the first to suggest that a vein might be found thereabouts. The Nevada *Transfer* says that G. F. Deetkin, an experienced metallurgist, reports the existence of a big block of the oxide of copper in the diggings mentioned, which will weigh four tons and yield six per cent of the pure metal. The vein pierces a stratum of tuffaceous slate, and oxide of manganese is found in considerable quantities near by.—*Appeal*.

Action of Sulphate of Copper when Employed as a Preservative of Wood.

Koenig has investigated the chemical reactions which occur when wood is impregnated with a preservative solution of blue vitriol. He finds as a general rule, that a certain quantity of basic sulphate of copper remains combined in the pores of the wood in such a manner that it cannot be washed out with water. The copper salt may be seen by its green color in the spaces between the yearly rings in the less compact portions of the wood, that is to say in those portions which contain the sap. Those varieties of wood which contain the most resin retain the largest amount of the copper salt,—oak, for example, retaining but little of it. The ligneous fibre itself appears to have little or nothing to do with the fixation of the copper salt, and indeed none whatever is retained in chemical combination, so that it cannot be washed out with water, by pure cellulose. When wood from which all resin has been extracted by boiling alcohol, is impregnated with sulphate of copper, it does not become colored like the original resinous wood, and the copper salt contained in it may readily be washed out with water. In like manner, from impregnated resinous wood all the copper salt may be removed, with the resin, by means of alcohol.

The constituents of the blue vitriol are consequently fixed in the wood by means of the resin which this contains. Further it is found that the impregnated wood contains less nitrogen than that which is unimpregnated and that it is even possible to remove all the nitrogenous components of the wood by long continued treatment with the solution of sulphate of copper. The nitrogenous matters being soluble in an excess of this solution just as the precipitate which forms when aqueous solutions of albumen and sulphate of copper are mixed is soluble in excess of the latter. Since the nitrogenous matters are well known to be promoters of putrefaction, their removal readily accounts for the increased durability of the impregnated wood.

The author hopes to explain in a similar manner the action of other salts, like chlorid of zinc, &c., which are used for preserving timber, and is now engaged in investigating the question.

The utility of blue vitriol as a preservative may also depend in a measure upon the resinous copper salt which is formed, by which the pores of the wood are more or less filled up and the ligneous fibre covered so that contact with the air is prevented and the attacks of insects hindered. It is suggested that those cases in which the anticipated benefits have not been realized in practice by impregnating wood with a solution of blue vitriol, may probably be referred to the use of an insufficient amount of this agent—i. e., where the wood was not immersed in the solution for a sufficient length of time. The action should be one of lixivation, not merely of absorption.

On the Velocity of Sound.

It has generally been considered that sound moves at a uniform velocity of 1,142 feet per second; and in every book on the subject rules are given by which the distance of any source of sound, such as a firearm or a flash of lightning, may be ascertained by estimating the number of seconds and fractions of a second which elapse between the ocularly-observed time of the occurrence of the phenomenon and the hearing the of sound which accompanies it. Doubtless many persons have in this manner amused themselves by estimating the distance of which certain violent lightning flashes must have been, and have taken comfort from the idea that, if a certain number of seconds have elapsed after the flash has taken place before the thunder is heard, they are safe from its effects; falling into the very common error or mistaking the cause for effect. The Rev. S. Earnshaw has, however, been engaged in some extremely interesting mathematical investigations respecting the phenomenon of sound, and has arrived at the theoretical conclusion that violent sounds are propagated far more rapidly than gentle sounds and that therefore all reasoning upon the distance of the flash, based upon the lapse of time between it and the thunder, is fallacious. Many instances of this fact are adduced in corroboration of the theory, in which the clap of thunder followed immediately after the lightning when, judging from the distance which the latter was from the observer, there should have been an interval of many seconds duration. These and similar instances have induced the above-named gentleman to enter upon a mathematical investigation of the theory of sound, and he arrives at the conclusion, contrary to the hitherto universally received opinion, that there is no limit to the velocity with which a violent sound is transmissible through the atmosphere, provided the phenomenon which produces the sound be sufficiently violent. Hence, it is probable that there is no sound which is propagated faster than a clap of thunder, its genesis being especially violent. This theory seems also capable of explaining the rumbling, rolling noise of thunder. It is only necessary to imagine that the sound at its origin is broken up, either by partial interruption or reflection, into several sounds of different degrees of violence. They would thus be propagated with different degrees of rapidity, and would therefore not fall upon the ear, if it were at any distance off, with a sudden crash, but in series of minor claps, or as a rattle. If this theory be true, the report of a cannon should travel faster than the human voice, and that of thunder faster than either.—*Lon. Phot. News.*

The Power of a Bird's Song.

When we hear the song of a soaring lark, we may be sure that the entire atmosphere between us and the bird is filled with pulses, or undulations, or waves, as they are often called, produced by the little songster's organ of voice. This organ is a vibrating instrument, resembling in principle the reed of a clarinet. Let us suppose that we hear the song of a lark, elevated to the height of five hundred feet in the air. Before this is possible, the bird must have agitated a sphere of one thousand feet in diameter; that is to say, it must have communicated to 17,888 tons of air a motion sufficiently intense, to be appreciated by our organs of hearing.—*Prof. Tyndall.*

SUGGESTIONS FOR REMOVING INK SPOTS.—If the ink is common nutgall and iron ink, a solution of oxalic acid will remove the spot at once. Those from ink which contains indigo, if on paper, are first bleached with chlorine water and then removed by hydrochloric acid; if on linen, first with a solution of hydrochloric acid of lime or Labarraque's solution, and then with acid. Blue ink is removed by treating the spot first with alkali, and washing it afterwards with some acid.

WIRE FACTORY.

The above illustration represents the premises now occupied by Messrs. A. S. Hallidie & Co., on Taylor near Chestnut street, in this city. In a former series of the SCIENTIFIC PRESS we gave a synopsis, together with some statistics of the manner and varied application of wire rope. This article is patented, and at present enjoys a world-wide reputation for its superiority over hemp rope. This firm have their principal depot 412 Clay street near Sansome, where a general assortment of rope wire and sieve work may be seen.

This firm are now and have been extensively employed in erecting wire suspension bridges; the one now in course of progress over Deer Creek, Nevada County, will be three hundred and twenty-four feet, between abutments, seventeen feet in width, and will require fourteen tons of wire for the cables, thirty-five thousand feet of lumber, and the cables are four and a half inches in diameter; over four tons of iron work have thus far been employed, costing only nine thousand dollars.

The Nevada County papers speak highly thereof. A similar bridge was built by them across the Klamath river.

Burning Quartz.

An experiment was recently made at a quartz mill in Butte county, with the following result: The mill would crush twelve tons of unburnt quartz rock in twenty-four hours, while of well burnt rock it put through easily eighteen tons in the same time, the only addition to the expense that of wood and labor, being thirteen dollars and fifty cents or two dollars and twenty-five cents per ton.

THE MALHEUR MINES.—The *Advertiser* says that Mr Smith, of Marion county, who was one of the prospecting party that went to the Malheur mines, arrived in the valley, a few days since, and reported that when he left, the party had met no success. They had given Adams, who report gold, there five days to find the place where the gold had been obtained by him, and if at the expiration of that time no discovery was made, they intend to hang him, (Anams).—*Dalles Mountaineer.*

ADAMANTINE BORON.—This name is applied by Deville to a new combination of aluminum and boric acid, recently prepared by him, which possesses the most remarkable properties. It is harder than the diamond, will cut and drill rubies, and even the diamond itself, with more facility than the diamond powder

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide," a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work. It is a neat and convenient volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

THE MINER'S COMPANION AND GUIDE.—In a recent notice of this invaluable work, we omitted to give some of its leading features of interest and value specially designed for our mining community and metallurgists. This book has been carefully prepared and published by the enterprising editor of the "Mining and Scientific Press," of San Francisco. It contains nearly one hundred fine illustrations, with three hundred pages of interesting and instructive matter, forming a neat little volume substantially bound, at the low price of two dollars. It is thus far the best mining work issued in this coast, having complete treatise on veins and lodes, timbering of mines, manual of metallurgy, the geology of California, and the most important of all, many new and interesting methods for separating gold and silver ores, and pyrites, together with a glossary of technical terms not contained in any other work. The miners of this coast will find this an indispensable hand-book. Every Californian should possess it.—[Sac. Bee.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins, and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for carrying in the pocket, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work the Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINER.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's treasured soil its hidden treasures.—[Union Temperance Journ.

SALES MINING STOCKS.

(Revised and corrected every week.)

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
 Central, \$625 per share.
 Ophir, \$1000 per share.
 Gould & Curry, \$225 per share.
 Chollar, \$15 per share.
 Lucerne, \$20 per foot.
 St. Louis, \$4 per foot.
 Mount Davidson, \$60 per share.
 Mark Anthony, \$8 per foot.
 Louise, \$18 per share.
 Brailley, \$5 per foot.
 Sacramento, \$10.
 Shelton Co., \$3 per foot.
 Josephine, Flowery, \$10.
 West Branch, Flowery, \$7.
 Harrison, Flowery, \$12.
 Yellow Jacket, \$25.
 Exchange, East Comstock, \$40.
 Monte Cristo, \$5.
 Home Ticket, \$5.
 Silver Mound, \$35.
 Sunshine, \$16.
 Ohio and Buckeye Co. Argentine, \$12.
 Chimney rock, \$15.
 Dargen, \$10.
 Rich Co., \$3.
 Miller, \$12.
 Augusta, \$6.
 Spanish Co. Plymouth Ledge, \$6.
 Chelsea, \$3.
 Coney Ledge, \$25.
 King Charles, at Flowery, \$6.
 Edgar Co., Great Western Ledge, Gelena, \$20.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
 Ophir, 12; issue, \$300 per share.
 Gould & Curry, 4; issue, \$500 per share.
 Chollar, 4; issue, \$300 per share.
 Lucerne, 1; issue, \$500 per share.
 Mount Davidson, 4; issue, \$200 per share.
 [Having completed all the requisite arrangements we lay before our readers a reliable list of prices of mining stocks of Utah.]

WHEELER & WILSON'S

FAMILY SEWING MACHINES:

NOT ONLY

THE BEST FOR FINE SEWING,

..BUT THE BEST FOR..

MANUFACTURING CLOTHING

..AND..

OTHER HEAVY WORK.

SAN FRANCISCO, June 9, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Casimere and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them cannot be surpassed.

Various styles of Machines have been employed on the above materials, but the Wheeler & Wilson is preferred.

DONALD McLENNAN,

Proprietor of the Mission Woolen Mills

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 300 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc., Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Elementary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lam-born.

The Discovery and Geognosy of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Disquisition on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

A. ROMAN & CO.,

507 Montgomery Street, San Francisco

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supersede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silver-smith, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Reaping and Mowing machine, and in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

Yours, truly,
 G. W. HAMMETT, A. BALDWIN,
 M. CROGER, CHARLES MCARLON,
 D. R. MCCLAM.

June 12th, 1860.

MR. STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday evening; it was raked thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harret's field, and I am pleased with its performance. The cam wheel power over that of the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging-bearings and boxing, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,

ELAM BROWN.

PACIFICCO, June 23, 1860.

MR. STANDISH—Sir: This is to certify that I have operated one of your mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife in clover, or eat any grass.

Witness: Washington A. Wilson, W. T. Hendrick.

LAFAYETTE, June 27th, 1860.

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. Further particulars at the office of the Press.

m19

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.
 2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.
 3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating two tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear is made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, I require of the Patentee,

Malis J. B. BEERS
 108 Clay street,

LEWIS COFFEY & RISDON'S

STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Boiler Making Establishment on the Pacific Coast. Owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market Streets.

Opposite Oriental Hotel, San Francisco, Cal.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....NOV. 16, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansone sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. SKETCHING and ELECTROTYPING. Designs of every description—buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will hear in mind that Mr. Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

Machinery for Dressing Ores.

We have at present nothing in the shape of machinery that will answer the great demand for crushing the thousands of tons of ore now being quarried from the different gold and silver mines. The old straight batteries with its horrible din, and other disadvantages are the only thing in vogue. Many mechanics and machinists have been eagerly pursuing wearied experiments, a few of which have hit upon some novel ideas, which are worth mentioning, as an improvement upon the rotary mill of the Minors' Foundry, Messrs. Goddard & Co.'s invention stands without a rival. The whole of the machine is made of cast and wrought iron, having comparatively little friction, a main shaft lifting the stamps alternately; it is now extensively employed in Washoe. Next in order is the patent mill of Mr. Moore of the Vulcan Foundry. This machine in point of fact, is similar to the above named mill, but has an elevator and belt, which by some is considered an excellent improvement. Among recent inventions we notice Mr. Coleman's Eccentric Quartz Mill, now in course of erection at the Union Foundry. We have seen it work two or three times and are favorably impressed with its practicability. The inventor assures us that he can crush three tons of ore in twenty-four hours. If this can be done we opine that this machine will have the preference over many others already in the field. Mr. Brodie formerly foreman in the same foundry is the inventor of an eccentric mill, as well as Mr. Wells the former draftsman in this foundry, has invented also an eccentric mill.

The New United States Court Rooms.

Agreeable to promise we give some interesting details of the above new halls, respectively occupied by Hon. Judge McAllister and Hoffman. In our last issue a neatly executed engraving of the building appeared, which was drawn and engraved at this office.

The United States District rooms, wherein Hon. Judge

McAllister presides, is forty feet square and twenty-one feet high. In the western part a splendid canopy trimmed with purple velvet plush, with an artistically carved golden eagle towering magnificently over the hench, the drapery and tassel work being of the richest and gaudiest material, and most tastily arranged, and was executed by Charles Plum of this city. Two large arm chairs beautifully carved with Union devices, appear under this canopy, in front of which the hench, is about ten feet long, exquisitely worked, of mahogany, as well as all the furniture, and were manufactured by Mr. Conrad, also of this city. Three semi-circular steps lead to the hench; the whole floor and steps being covered with a neat figured rich Brussels carpet. To the right of the Judge's bench is the Marshall's desk, nearly in the center of the hall the District Attorney, and on both sides are arm chairs neatly cushioned for juries, etc. Four spacious entrances (including one folding door or main entrance, immediately opposite the hench) lead to this hall. A massive hnt neat railing is placed across the floor, to preclude spectators from intruding inside, and leading from the right hand side to the Judge's private entrance.

Light is admitted through eight pannels six feet square, handsomely embellished with fret or scroll work, for ventilating purposes. In the center of each an artistic device stained on glass by A. Thorning, a renowned scenic artist in this city. Immediately over the Judge's seat the full seal of the United States is thus magnificently executed, also a similar device of the seal of California. Directly in the center is a circular silvered cone, six feet in diameter, for the reception of sixteen gas jets. Here we wish to remark that the practical experience of Mr. Platt in his other large halls and buildings, proves conclusively that a saving of fifty per cent. is effected by this mode of lighting, besides doing away with the disagreeable and unhealthy odor emanating from gas, which is carried of through the ventilating scroll work surrounding the pannels and cone.

The Court Room of Hon. Judge Hoffman is on the Jackson street side, thirty by forty feet, twenty-one feet high: the same stylo of carpets, benches, seats, desks, as in the other hall are neatly and substantially provided. The only difference we notice is, that the pannels through which light is admitted are only four feet, and of which there are fourteen. The thirteen seals of the original States are artistically stained and executed by the same artist as those in the above hall. Over the canopy the fourteenth panel is the great United States seal.

The whole arrangement reflect great credit upon the proprietor, and those employed in the construction of these premises.

New Improvement on Amalgamators.

An excellent improvement has just been perfected by Mr. Palmer of this city, in the application of a steam reservoir or chest to any and all kinds of pans or amalgamators for extracting the precious metals. By this method the pans which were heretofore worn out by dint of the grinding of the millers is now entirely obviated. The application of steam to mercury is efficacious, being one of the greatest auxiliaries for working ores of precious metals. We shall soon have an illustration giving details thereof, the drawings being already underway.

Pacific Medical University.

Last Tuesday evening we chanced to pass through Third street with our artist, and when in the vicinity of the above place we concluded to hear part of the lecture. On entering we found Prof. Lane giving in a clear and distinct voice a lesson in Physiology. This is the Pioneer University on this coast, and apparently prosperous.

Chas. R. Bond, Esq., formerly County Assessor, has removed his Real Estate Agency, and also the Patent Agency of Messrs. Wethered & Tiffany to 410 Montgomery street. Mr. Bond will be pleased to attend to any and all commissions in his branches, and we recommend him for his promptitude and strict business application.

BURNED TO A CINDER.—At Excelsior, Sierra county, on the 30th ult., the timbers forming the chimney of the ventilating shaft belonging to the Dead Broke company's tunnel took fire, and Mr. Samuel Cooper, at the moment of throwing the chimney over, slipped and fell through the shaft, a distance of fifty feet, at the bottom of which a very hot fire was burning, and before he could be rescued was hurled to a cinder.

Chemical Nomenclature.

From the revival of learning, after the fall of the Roman empire, to nearly the close of the seventeenth century, chemistry was chiefly confined to those who followed it with alchemical views. These persons, many of whom knew that they were deceiving their patrons, while others were desirous to conceal their self-deception, or to create admiration, by the appearance of having done much, were anxious to give every product of their laboratories, a mysterious, extraordinary, or unintelligible name; as they did not act in concert, the same preparation obtained very different names; and as they were, with few exceptions, as eminent for ignorance as effrontery, and carried on their operations at random, they examined but superficially the substances which they undertook to denominate, and knew not to what they were indebted for their leading properties. Such names as *horn moon*, *mercury of life*, *the wonderful salt*, *the salt with many virtues*, form but a small specimen of a prodigious number, equally inappropriate and ridiculous. Hence, when the dreams of alchemy were broken by the dawn of a more enlightened day; when men who had the promulgation of truth only for their object, became chemists, from a persuasion of the advantages which the cultivation of that science would afford to mankind; they found it difficult to unravel the confusion which the misnomers of their predecessors had created. In proportion as discoveries were multiplied, the want of a regular and appropriate nomenclature increased, and formed a strong bar to the general diffusion of a taste for chemical researches. A few innovations, which were made by single individuals, in order to accommodate the language of chemistry to the improved state of knowledge, served only to show how much was still wanted. It was perfectly obvious that names founded upon a mistaken view of the properties of things, tend to the propagation of erroneous opinions; and that when a vast number of substances are designated at random, without any connection in name, although nearly related in composition, the mere effort of memory to recollect these names, will exceed the effort which ought to be required for the acquisition of a science. Towards the close of the last century, therefore, several eminent French chemists determined to take a comprehensive view of the subject, and to remodel the whole system of chemical nomenclature, a task which they completed in 1787. Their object was to reject all the old names which were known to convey false ideas, but to preserve those which were not of this class, and to which custom had given a currency scarcely, and not usefully, to be checked; they at the same time introduced new terms of appropriate derivation; and the method of forming compound terms, so as to indicate the composition of compound bodies, was pointed out. This system of nomenclature possessed so much merit, that the adoption of it soon became general in France, and from thence it spread with great rapidity to other countries, where it was received either entirely, or with such improvements as experience warranted. The objections which have been urged against it are futile; they have chiefly amounted to this; that it is not absolutely perfect, and will, by the progress of discovery, hereafter require to be modified. On the contrary, a high eulogium on its value and opportune establishment, is conveyed by the opinion of several eminent chemists, that the present state of chemistry could not be communicated, much less remembered, by the language previously in use.

Salmon Mines.

DEAR D * * * :—We got into these mines on Saturday afternoon. On our way to camp we saw the miners taking the dust out in abundance. We tried to get claims, but found that they were all taken. This morning we went out prospecting, and found from 3 to 15 cents to the pan. That did not suit us, but I think that we will strike something to-morrow or next day. There are a great many good claims here. They have taken out five pounds a day with a rocker. Most of the claims prospect from 50 cents to five dollars to the pan—that is on the rich parts. There is a Dutchman, who got out forty dollars to a pan. Wages are from ten to fifteen dollars a day. There is no show for sluices here, all the work being done with rockers. Shovels are selling at from twelve to twenty dollars a piece. Flour is forty dollars per hundred. This is about all that I can write you. By next week I hope to have those rich claims that you and I used to talk about. If I strike a good thing you will hear from me shortly.

Yours, &c.,

W. ILLIDGE.

NEW AMALGAMATING PROCESS.—Simultaneously with the discovery of coal beds, a wonderful improvement in reducing silver ores and saving gold is announced: it being the handywork of Mr. Hatch, assayer at French's mill, and reputed a man of skill in his calling. I know nothing of its principles or merit, but hear it much talked of amongst the workers of the precious metals. It claims to save one-third more gold than any other process ever yet devised, and at an expense merely nominal, compared with that heretofore incurred in the process of amalgamation.

MOUNT DIABLO COAL.—The Mount Diablo coal is the cheapest in the market. It sells for twelve dollars per ton.

An old resident of Marysville, Mr. Grow, has just returned from Durango, Mexico, where he owns an interest in the silver mine called Guadalupe del Los Angeles. This mine is situated in the high mountain range about one hundred and fifty miles east of the coast, by the road, and twenty from the nearest beach. The mine is a small one, and the grade of the ore is not particularly bold, but on the mountain side, and well abandoned by its former native workers, Mr. Grow and his partners having re-occupied it lately. The limestone, when subjected to the roasting process with borax, readily yields globules of pure silver. The quartz veins in the rock show the metal in its pure state. Indeed all of the rock contains it in that condition. The ore is not so rich as some of the other mines of the district, but the owners have been working it preliminarily with an arrastra, treating the crushed rock with quicksilver and retorting the product. By this process very profitable yields have been procured, the lowest being at the rate of \$1,100 to the ton, the best \$3,500. Samples have assayed at the rate of \$6,000 per ton. The ore contains a small proportion of gold, enough to make it pay for the pound, and a pound of gold is worth about \$100. Mr. Grow has some very rich specimens of the ore, and has exhibited to us three and a half ounces of silver which he extracted from four pounds of rock. He undoubtedly has a very valuable interest in Durango. He represents that country as being a pleasant one to live in, and the natives as being exceedingly kind and hospitable. He says that the country is well adapted to the raising of the old silver mines have passed into the possession of our countrymen, who are not themselves quite secure, though they are cautious enough to keep prepared for trouble. The robbers do not molest that part of Mexico, the people being too poor to attract them, and lightly guarded "conductas" of specie, conveying a quantity of a million of dollars at a time pass through in safety, and the Mexicans employ many Americans to work their mine systems heavily and on a large scale in a short time.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munn & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS
FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.
[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

Coal.

Imports from January 1st to September 15 :

Anthracite, tons	16,903	Sydney, tons	11,304
Cumberland cks.	1,144	Japanese tons	25
English, tons	14,165	Vancouver I, tons	4,536
Chili, tons	19,135	Coast, tons	11,384

The sales of 3000 tons Anthracite, to arrive, which occurred some little time since, and were not made public, are the only transactions of moment which have come to our knowledge. They were effected at \$18 @ 19 per ton, with some slight resales at \$20. Our quotations give a true index of the market.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows :

For parting silver from gold when gold is below 300—1000ths. fine	3cts per oz.
" from 300—1000ths. to 750—1000ths fine	7cts	" "
" " 750—1000ths to 950—1000ths	14cts	" "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce ½ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight

301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce; ½ per ct. value of silver for making bars; also when gold is contained per ct. on gross value of gold for coining. Refining charge in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. ½ per ct. gross value to be paid for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. ½ per ct. gross value for coining, when gold is contained, refining charge the same in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. ½ per ct. value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule hereafter be, that the value of gold contained in the value will be paid in gold coin, and the value of silver in coin. The value of the silver will be calculated at 2 per standard oz, and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge ½ per cent. will be made additional. Bullion of the denomination will be entered on the gold and silver register as most congruous with the physical aspects of the metal but in the warrant it must be marked that so much is paid in gold and so much in silver, according to the tests reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent R. J. Stevens.

PHILAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHILAN'S TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The billiard will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of who admire and practice the GAME OF BILLIARDS. DAN LYNCH, 720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and salesroom for

Phelan's Patent Combination Cushions and Modern

Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a variety of styles and finish, and can also test the superiority of the cushions and Tables. Mr. DAN LYNCH will always be on hand ready to give all required information with regard to the merits of the JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables.

S. HALLIDIE & CO.
PATENT
ROPE MANUFACTURERS
—AND—
Suspension Bridge Builders.

OFFICE: WORKS:
Clay Street, North Beach.
ROPE IS FORTY PER CENT. LIGHTER, LESS THAN ONE HALF
DIAMETER, AND SIX TIMES AS DURABLE AS MANILLA
OR HEMP ROPE OF EQUAL STRENGTH, AND IS UNAF-
FECTED BY CHANGE OF WEATHER.
It is more particularly adapted for
RICK GUY ROPES, FERRY ROPES
and for hoisting from Deep Shafts and Inclined Planes.
Companies or Ferry Owners, who use rope for winding, hoisting, or
other purposes, will effect an immense saving by ordering WIRE ROPE
from Agents.
Scales, with scale of weights, steel, straight, and list of prices are
sent free to those interested, who can then compare the cost
of Wire Rope, by addressing the manufacturers.

SUSPENSION BRIDGWORK!
SUSPENSION BRIDGES, Aqueducts, Etc., erected on moderate terms.
PERMANENCY GUARANTEED.

A SPLENDID OPPORTUNITY.
AGRICULTURAL MACHINERY.
I have taken, for five years, a large portion of
the State Prison Labor, for the sole purpose of manufacturing
AGRICULTURAL IMPLEMENTS AND CABINET WARE
for sale, at a Great Sacrifice, in order to close out my present stock
on the first of 1861, the following articles:
TWELVE-HORSE STEAM THRESHING MACHINES;
M. RUSSELL'S EIGHT AND TEN-HORSE THRESHING MACHINES.
A. PITT'S GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND
TWELVE-HORSE POWER, with all of C. M. Russell's latest im-
provements;
PRESSERS, REAPERS AND MOWERS;
TRAVERSING TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE
RACKS.
The above goods will be sold at the Lowest Prices, either for Cash, or
on approved paper at a low rate of interest.
THOS. OGG SHAW,
33 Sacramento Street.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission
and Howard, San Francisco, California.—By recent additions to
the extensive establishment, we can confidently announce to the public
that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are en-
abled to do work cheaper and quicker than any other establishment on this
side of the Rocky Mountains.
We make to order, and have for sale, High and Low Pressure Engines,
both Marine and Stationary; Straight Quartz Mills of all sizes and
designs; Stamp-mills and dies of iron, which is imported by us expressly
for this purpose—its peculiar hardness making shoes and dies last two or
three months. Mining Pumps of all sizes and kinds; Flouring Mills; Ranges,
Saw, Mulin, and Circular Saw Mills; Shingle Machines, cutting 25,000 per
day, and more perfectly than any now in use. One of these shingle machines
can be seen in operation at Metcalf's mill in this city.
Knox's Amalgamator, with the latest improvements; Howland & Han-
com's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now
in use.
Quartz Screens, of every degree of fineness, made of the best Russian Iron.
Car Wheels and Axles of all dimensions; Building Frames; Horse Powers;
Smut Mills; Rubber Frames; Wind Mills, of Hunt's, Johnson's and Lute's Pat-
ent; and to make a long story short, we make castings and machinery of
every description whatever; also, all kinds of Brass Castings.
Steamboat work promptly attended to.
Thankful to the public for their many past favors, we would respectfully
olicit a continuance of their patronage. Before purchasing, give us a call
and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—
BRYAN'S IMPROVED MILL.
THIS MILL will Crush, with the same weight
of Stamps, Twenty-Five per cent. more rock
than any other mill yet invented. It is also
Cheaper, more Durable and run with Less
Power. All parts of it being fitted together
before leaving the shop, it can be put up
set at work Crushing the Ore, in Ten Hour
after arriving on the ground!

Every one exclaims after seeing the Mill in
operation, "Why has not so perfect and yet
simple a mill been invented before? It would
have Saved the Fortune of many a Miner
expended in worthless machinery, and enriched
the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS
Of all sizes, furnished with dispatch.
ADOPTED AND NOW USED BY
Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, } San Francisco
Union Reduction Company, }
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated
Vermont Reaper and Mower, which is unsurpassed for Simplicity, Dura-
bility, convenience and thoroughness of work.
The high estimation in which this Machine is held by those farmers who
have used it, justifies the expectation that, with the late improvements, it
will become the leading machine, when its superior qualities are generally
known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE
HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to un-
even surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in
constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving
his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to
give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently
you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter bar being hinged to the machine, can be picked up with
out removing bolt or screw.
- 8th. The cutter bar is readily raised by a lever, which is very convenient
at the corners of the land; when raised, the machine will turn as short and
easily as any two wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it
easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one
for mowing, the other designed expressly for reaping, which, with other
improvements, should command the attention of every farmer.
- 12th. We invite Farmers wishing a machine to call and see before purchas-
ing. KNAPP, BURRILL & CO.,
ap10 310 (Old No. 80) Washington street, near Front, San Francisco.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS!

The undersigned, having had great Experience and Fa-
cilities for completing and carrying out inventions and improvements
upon all kinds of Machinery and Implements, also preparing the requisite
Drawings, Models, Drafts and Specifications, and is otherwise conversant
with all principles in Mechanics of modern practice and could prove, there-
fore, of invaluable aid to Inventors and Discoverers. These contemplating
bringing their inventions in a proper shape before the U. S. Patent Com-
mission are particularly requested to consult the subscriber.

WILLIAM A. BURKE,

At A. Kohler's Piano and Music House,
np11 Sansome street, between Clay and Commercial, up stairs.

RICHARDSON'S PATENT WASHING MACHINE.

We give herewith an illustration of one of the best household institutions yet invented, and we assert that when its merits shall have been fully tested, no family will be without it. The cost is so trivial that the amount thereof will be saved in soap and labor inside of six months. The inventor has in our presence washed slips of paper without making the slightest indentation or tear. As will be seen in the cut, a main cylinder (fluted) having a shaft, propelled by a crank can be revolved both ways; under this cylinder and in the box are a number of rollers conformable to this cylinder, and are held against the cylinder by springs, so that when any thickness passes between the cylinders and rollers, by dint of the springs the rollers will descend. Similar rollers are applied over the cylinder for the same purpose. The inventor has a caveat filed, but is now actively employed in perfecting some important improvements. The ringer, as in other machines, is also applied. We shall soon speak again of this wonderful California invention.

EXTENT OF THE COAL FIELD.—It has recently been found that the coal indications extend to the north and south of the original Whitman claim, a distance of two or three miles making the entire range over which good signs are met with fully five miles long, and about two and a half wide. Quite a number of claims have lately been surveyed for different parties along El Dorado Cañon, though we do not hear that any genuine vein has yet been struck in that vicinity. The heaviest deposit so far discovered is on Col. Whitman's grounds, though several other claims adjoining his on the north promise equally well. The report of coal having been found in the Flowery district, started a short time since, seems to lack confirmation; though the Whitman coal field evidently stretches that way, and the article will probably yet be found in that district, at a greater depth than on the elevated lands further south.

Gold mines on the Laguna Mountain, near Fort Yuma, have been discovered. The diggings are half a mile from water, and hard working men can make from twenty dollars to forty dollars per day.

SALMON RIVER MINING DISTRICT.

The above illustration presents the Salmon River mining ground. We refer our readers for interesting and important news from this quarter to our past Mining Summary. If all we have thus far published or heard of the great wealth reported to exist there, be true, it will certainly eclipse California? *nons verons*.

ABBREVIATIONS.—P, Pioneer Gulch; S, Smith's Gulch; B, Baboon Gulch; N, Nason's Gulch; W, Willamette Gulch; M, Miller's Creek; S F, South Fork; R, Rhodes' creek; A, Agency; Q, Quartz creek; C, Canal creek, O C,

Oro Fino city; S F M, South Fork Mines; E C, Elk City; L C, Lawyer's Cañon; M, Millersburg.

Good for Working Men.

Owing to the large number of miners having left for the new mines, miner's wages in this country have increased, and drifters being scarce are very readily engaged at four dollars a day and board. There are a great many extensive drifting claims in this country that are paying rich, after good wages are paid, some of which are rented to companies at enormous prices.

Krupp's Steel Works at Essen, Germany.

The cast-steel manufactory of Krupp, of Essen, is the largest steel manufactory in the world. It is situated on the skirts of the town, in the midst of the coal mines, and with its buildings and yards, a space sixteen hundred and eighty-eight hundred feet; fifteen large chimneys tower up from it, and an incredible number of smaller ones are continually in use. A cloud of smoke hangs all the week over the works, and only disappears with the quiet Sunday. About four hundred men are employed in the various works, and a hundred and fifty tons of coal are consumed each day in the process employed for manufacturing the steel. After many expensive and laborious experiments, Krupp, and is kept a profound secret, only a few trusted men being allowed to work in the room where the iron mixtures are made. The method said to be found the principle of melting together carbonized and deoxidized iron, cast and wrought-iron, thus obtaining a steel which has the known composition of steel.

I was told by a metallurgist at Essen that he had succeeded in obtaining steel in the same way (indeed, the process which has long been known to chemists); his attempts to make crucibles to stand the heat and of the materials were unavailing. Others, again, say that the art lies in the application of a peculiar kind of glass, which protects the smelter metal and allows it to unite properly. Be the process what it may, the result is remarkable. England has sought in vain to compete with the Krupp manufactory, but she has always failed. No count even approached in the size of its production the mass of pieces which are turned out here. A mass of ten thousand pounds of cast-steel was sent to the Paris exhibition, the largest shaft of the same material ever made here was turned, thirty feet long and ten inches in diameter, now in use on a French steamer, and cost six thousand dollars; and a single piece of steel has been produced weighing twenty thousand pounds.

Car axles of steel have been lately manufactured by Mr. Krupp binds himself to pay a penalty of ten thousand five hundred dollars if any that he sells break within five years, which, I may say, is throwing the responsibility on this species of railroad accidents on the right shoulder. Railroad car wheels and bells are sometimes made of steel, but the chief manufacture at present is cannon. They are made from the smallest size up to sixty-eight pounds and are cast in a single piece and afterwards bored out. The construction of these guns is remarkable; they consist of a thick solid cylinder of steel, made precisely half the thickness of the cast-iron guns (this proportion assumed arbitrary since no experiments have been instituted to prove proper proportions which should be adopted with this material), but the metal mass is not heavy enough to stand the recoil of the powder and ball, and consequently a heavy shell of cast iron surrounds the breech. The excellence of the guns as warlike instruments is everywhere acknowledged.

The Coal Range.

The discovery of coal in Mount Diablo about a year ago disclosed the fact that the Pacific Coast was not exclusively a primary formation, with a superficial stratum of alluvium, but on the contrary, we reasonably expect to find alluvial deposits comprising the secondary and tertiary formations. The recent discovery of extensive beds of coal in this territory, more fully justifies this expectation. Nor does the proof end here. From a late number of the *Deseret News* published in Salt Lake we clip the following extract, which would seem to indicate that the coal here continues to some interruptions of course—several hundred miles toward. If these discoveries prove as valuable as anticipated, our western coast will not only excel the East in the production of precious metals, but rival her in the production necessary for the useful arts. The *News* in the paragraph included to say:

Mr. S. P. Hoyt, who is building a grist mill on Weber, below the mouth of Silver creek, in Summit county, brought to this city a few days since, some coal taken from a newly discovered mine in that vicinity, some six or seven miles from that opened last season. Some of the local smiths tested it and pronounced it better than any they had before seen, which had been taken from the Weber mine, and equal to any they had ever used in the territory. Weber country is undoubtedly an extensive coal field, if the mines were opened and properly worked they would supply the whole territory with coal for fuel and manufacturing purposes. The coal there is supposed to be inexhaustible.

VOL. IV

SAN FRANCISCO, SATURDAY, NOVEMBER 23, 1861.

NO 10.

Choice of Specimens.

In the first place, we must earnestly recommend the tyro in mineralogy to start with the fixed determination of limiting the dimensions of his specimens. This will be found of great advantage as it permits all the drawers of the cabinet to be of uniform depth; thus not only giving a neater appearance, but greatly facilitating the arrangement of substances. As to what that size should be, depends entirely upon the means and the taste of the collector and we shall not presume, therefore, to dictate, but may observe that specimens measuring two or three inches in length, and proportionate breadth, will, if selected with discrimination, usually be four sufficiently large to illustrate both the beauty and characters of a mineral. It is, of course, impossible to obtain a good specimen of every substance of exactly the same size, as many are very rare, and others never occur of large dimensions at all. Of these we must be content with such specimens as can be procured, although they may not reach the size fixed on as the standard.

When choosing a specimen, considerable care should be exercised in selecting such a one as best exhibits the characters peculiar to the substance, particularly the crystalline form; and should many varieties of the same substance be known to occur, those should be preferred whose colour, transparency, &c., are most distinct. It is, also, frequently important to possess, for comparison, perhaps identical varieties, from different localities. In all possible cases, it is desirable that a portion of the gangue, or matrix, in which a substance is found, should accompany the specimen.

Frequently, a large and clumsy specimen may, by the aid of a hammer and a pair of cutting pincers, be reduced to a very neat and neat one. This requires great dexterity, as an unpractised hand is very likely to destroy, by a misdirected blow of the hammer, the very portion whose preservation is not desirable. Previously to the commencement of operations, therefore, the structure of the substance should be minutely examined, so as to observe in what direction the blow would probably take effect. Those minerals which possess a lamellar structure may be easily divided in the direction of the laminae, but with great difficulty in the contrary direction. But the greatest difficulty is experienced when the substance is in delicate and fragile crystals occurring on a gangue of a hard and tough nature, as the first blow would cause the crystals to fall off, and yet make no impression on the gangue. In such a case, it is advisable to set the lapidary to work, who will, without much danger to the desired portion, separate therefrom the offending gangue. These suggestions, however, are perhaps unnecessary, as in most instances the dealer in minerals will have reduced his specimens as far as might be safely attempted.

The number of distinct species of minerals and their varieties is so immense, that even when the funds are ample, it must be a work of many years to form a collection whose number shall approach to that which is known to exist. We would, therefore, advise the student first to direct his energies and resources to procuring one good average example of each distinct substance, rather than to accumulate a large number of varieties of one species, whilst others are neglected altogether. The varieties may be added as opportunity offers.

Another excellent plan for the beginner is to purchase a collection already prepared, containing fair specimens of most of the principal common substances, and so to form a nucleus, around which to gather any acquisitions that may afterwards become desirable by his increased knowledge. Such a collection might be obtained at a very moderate cost: the principal expense, and, let us add, the principal pleasure, would be experienced in adding to it such individuals as it did not contain, in consequence of their scarcity

The Cabinet.

Before the learner has proceeded far in the accumulation of specimens, he will find it essential to procure a cabinet to contain them, and that without this his specimens would be an encumbrance and a source of annoyance instead of agreeable recreation. Scattered here and there, in an odd drawer,—on the sideboard,—occupying every available table,—on the floor or the mantel-shelf,—we fear that the unconscious specimens and their delinquent owner would meet with but little sympathy or encouragement from those whose hearts were not so devoted to science as to quietly acquiesce in such an infringement of household regulations. Besides this, infinite damage would result to the homeless specimens themselves, which would certainly be subjected to the daily dustings and sweepings that seem indispensable to a well-ordered apartment, but which processes would probably tend to reduce a finely pointed acicular crystal to an obtuse, a very obtuse, pyramid or prism.

The cabinet should be made of mahogany, never of cedar, because from that wood a resinous matter exudes, which, covering the specimens in the drawer, renders most of them in great part valueless. Many fine collections, both of shells and minerals, have been much damaged through being placed in cabinets made of cedar-wood; it being almost impossible to remove the clammy covering without destroying the specimens.

Should our suggestions as to limiting the size of specimens be followed, the drawers of the cabinet may be made all of the same depth, which, in addition to facility of arrangement, gives to the structure a neatness of contour highly desirable in everything appertaining to science. The cabinet should be enclosed in folding-doors, both to prevent the entrance of dust, which would detract greatly from the beauty of the treasures inside, and to secure those treasures under lock and key from the deranging and injurious effects of curiosity and rough or inexperienced handling. A cabinet of minerals or other objects of natural history should always be sacred to its possessor, who would otherwise be deprived of one of his chief pleasures, namely, that of exhibiting its contents to those who can appreciate or who will admire.

To contain objects of natural history, few cabinets will bear comparison with those produced by Mr. William Edwards, of High-street, Camden-town, whose excellent workmanship, long experience, and moderate charges, we must, at the risk of appearing invidious, recommend to the patronage of those who require such services.

In order to prevent specimens from being damaged by collision with each other when in the drawers, various plans have been adopted. In some collections they are placed on pads of white silk, separated by thin strips of black wood. This plan is more adapted to large collections intended for the public gaze, as at the British Museum, than for a small private cabinet. Occasionally cotton-wool has been substituted for the white silk, but this is very objectionable, as, on a specimen being taken up, the wool will frequently cling to some projecting portion, and its removal will cause injury to its fragile structure.

The best plan, in reference to private collections, is to place the specimens in card trays, fitting closely into the drawer. These trays should be rather larger than the average size of the minerals, so that there may be a white margin between each individual, serving more completely to isolate one from the other, and, at the same time, adding greatly to the chaste ensemble of the drawer. For the same reason, the slip of paper on which the name of the substance is written should be smaller than the tray. The locality of each specimen should be carefully added beneath its name.

Besides these separate names accompanying the specimens, it is advantageous to fasten running numbers to them with gum, and to keep a catalogue of their names and localities, correspondingly numbered.

Coal Oil as a Remedy.

Some months ago we published a communication from Prof. J. B. Turacr, of Illinois College—and which had appeared in many agricultural papers—setting forth the virtues of Korosene or coal oil, as a remedy for rheumatism, salt rheum, bruises, and some other complaints. We expressed our belief that it would be found a valuable remedy for the complaints named. We are glad to learn, that it has been tried in several cases of rheumatism and effected cures. The rheumatism is one of the diseases of this country, and a remedy for it is of very great value. We feel that those persons who have been relieved from this disease, by the application of coal oil, owe a duty to us, and to those suffering from the disease, to furnish the facts of their cure by the remedy named, for publication in this paper. Think of it! Should those who have suffered sleepless nights and painful days, and have been incapacitated from the performance of their daily labors by this disease, neglect when cured, to give hope to others similarly afflicted, that a remedy, easily attainable, at little cost, is at hand for their relief?

It has come to our knowledge that this remedy has been used in cases of sore throat, sore from colds, perhaps bronchitis—with great advantage, even effecting cures. If this be so, its value can scarcely be appreciated. We again recommend persons afflicted with rheumatism, to try this remedy. Bathe the parts affected morning and evening, with the well—and dry it by the fire. The flavor of coal oil is not agreeable to many, but it soon passes away. Our own opinion is, that it is worth all the nostrums and patent medicines ever invented for the cure of rheumatism. —Oregon Farmer.

The Silver Mines.

Considerable excitement pervades the upper country relative to the newly discovered silver mines, and already a large number of claims have been taken up. Four mining districts have been laid out, and are known respectively as the "North Powder River District," "South Powder River District," "Grand Ronde Silver Lead," and the "John Day District." The claims embrace a quarter of a mile each, and are numbered as taken up. On the "North Powder River District" thirty-two claims have already been taken. An equal number of claims have been taken up in the remaining districts. To make sure of their claims some of the parties have had them registered in the County Clerk's office. On Saturday last, five claims in each of the Districts were thus registered. They stand in the names of A. J. Thibodo, Thos. J. Reiley, Edward Everett, Sam'l M. Baldwin, and H. Way. These gentlemen possess the means to work their claims, and should the assay of the mineral already taken out prove favorable, they will immediately commence operations. What with gold and silver excitements, we bid fair to have lively times.

Good for Working Men.

Owing to the large number of miners having left for the new mines, miner's wages in this county have increased, and drifters being scarce, are very readily engaged at \$4 per day and board.—There are a great many extensive drifting claims in this county that are paying rich, after good wages are paid, some of which are rented to companies at enormous prices.—Yreka Journal.

More Discoveries.

According to the San Bernardino Patriot coal, of a superior quality, and alabaster, of great purity, have been found on the Santa Ana River, in San Bernardino county. Gold, silver and copper have been found in promising richness along the Mojave, at different points.

RICHARDSON'S PATENT WASHING MACHINE.

We give herewith an illustration of one of the best household institutions yet invented, and we assert that when its merits shall have been fully tested, no family will be without it. The cost is so trivial that the amount thereof will be saved in soap and labor inside of six months. The inventor has in our presence washed slips of paper without making the slightest indentation or tear. As will be seen in the cut, a main cylinder (fluted) having a shaft, propelled by a crank can be revolved both ways; under this cylinder and in the box are a number of rollers conformable to this cylinder, and are held against the cylinder by springs, so that when any thickness passes between the cylinders and rollers, by dint of the springs the rollers will descend. Similar rollers are applied over the cylinder for the same purpose. The inventor has a caveat filed, but is now actively employed in perfecting some important improvements. The ringer, as in other machines, is also applied. We shall soon speak again of this wonderful California invention.

Krupp's Steel Works at Essen, Germany.

The cast-steel manufactory of F. Krupp, of Essen, is the largest steel manufactory in the world. It is situated in the skirts of the town, in the midst of the coal mines, and with its buildings and yards, a space sixteen hundred and eighty feet; fifteen large chimneys tower up, and an incredible number of small ones are continually in use. A cloud of smoke hangs all the week over the town, and only disappears with the quiet of Sunday. About five hundred men are employed in the various works, and five hundred and fifty tons of coal are consumed each day in the process employed for manufacturing the steel was discovered after many expensive and laborious experiments by Krupp, and is kept a profound secret, only a few trusted men being allowed to work in the room where the iron mixtures are made. The method is said to be founded on the principle of melting together carbonized and deoxidized iron, cast and wrought-iron, and thus obtaining a mixture which has the known composition of steel.

I was told by a metallurgist at Essen that he had succeeded in obtaining steel in the same way (indeed, the process which has long been known to chemists); but his attempts to make crucibles to stand the heat and of the materials were unavailing. Others, again, say that the art lies in the application of a peculiar kind of glass, which protects the smelted metal and allows it to unite properly. Be the process what it may, the result is remarkable. England has sought to compete with Krupp's manufactory, but she has always failed. No country has even approached in the size of its production the pieces which are turned out here. A mass of ten thousand pounds of cast-steel was sent to the Paris exhibition, the largest shaft of the same material ever made here was turned, thirty feet long and ten inches in diameter, and now in use on a French steamer, and cost six thousand dollars; and a single piece of steel has been produced weighing twenty thousand pounds.

Car axles of steel have been largely manufactured by Mr. Krupp binds himself to pay a penalty of ten thousand five hundred dollars if any that he sells break within five years, which, I may say, is throwing the responsibility of this species of railroad accidents upon the right shoulders. Railroad car wheels and bells are sometimes made of steel, but the chief manufacture at present is cannon. Cannon are made from the smallest size up to sixty-eight pounds and are cast in a single piece and afterwards bored. The construction of these guns is remarkable; they consist of a thick, solid cylinder of steel, made precisely half the thickness of the cast-iron guns (this proportion is assumed, since no experiments have been instituted to proper proportions which should be adopted with this material), but the metal mass is not heavy enough to stand the recoil of the powder and ball, and, consequently, a heavy shell of cast iron surrounds the breech. The excellence of the guns as warlike instruments is everywhere acknowledged.

The Coal Ranch.

The discovery of coal in Mount Diablo about a year ago disclosed the fact that the Pacific Coast was not exclusively a primary formation, with a superficial stratum of alluvium, but on the contrary, we reasonably expect to find deposits comprising the secondary and tertiary formations. The recent discovery of extensive beds of coal in the territory, more fully justifies this expectation. Nor do we need proof end here. From a late number of the Deseret published in Salt Lake we clip the following extract, which would seem to indicate that the coal range continues some interruptions of course—several hundred miles toward the west. If these discoveries prove as valuable as our western coast will not only excel the East in the production of precious metals, but rival her in the production of the useful arts. The News in the present issue included to say:

Mr. S. P. Hoyt, who is building a grist mill at Weber, below the mouth of Silver creek, in Summit county, brought to this city a few days since, some coal taken from a newly discovered mine in that vicinity, some six miles from that opened last season. Some of the smiths tested it and pronounced it better than any they had before seen, which had been taken from the Weber country, and equal to any they had ever used in the territory. Weber country is undoubtedly an extensive coal field, if the mines were opened and properly worked they could supply the whole territory with coal for fuel and manufacturing purposes. The coal there is supposed to be inexhaustible.

REMOVAL.

BARRON & CO. HAVE REMOVED to the northeast corner of Main and Jackson streets.

MAPS! MAPS! MAPS!

FOR EVERY Description—War Maps of the latest date. We are receiving Maps and Atlases, from J. H. Colton, by every steamer. W. HOLT, 303 Montgomery St. Corner of Pine, Map Dept.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, NOVEMBER 23, 1861.

NO 10.

Choice of Specimens.

In the first place, we must earnestly recommend the tyro mineralogist to start with the fixed determination of limiting dimensions of his specimens. This will be found of great advantage, as it permits all the drawers of the cabinet to be of uniform depth; thus not only giving a neater appearance, but greatly facilitating the arrangement of substances. As to what that size should be, depends entirely on the means and the taste of the collector and we shall presume, therefore, to dictate, but may observe that specimens measuring two or three inches in length, and proportionate breadth, will, if selected with discrimination, fully be found sufficiently large to illustrate both the nature and characters of a mineral. It is, of course, impossible to obtain a good specimen of every substance of the same size, as many are very rare, and others occur of large dimensions at all. Of these we must content with such specimens as can be procured, although they may not reach the size fixed on as the standard.

When choosing a specimen, considerable care should be exercised in selecting such a one as best exhibits the characters peculiar to the substance, particularly the crystalline form; and should many varieties of the same substance be known to occur, those should be preferred whose color, transparency, &c., are most distinct. It is, also, very important to possess, for comparison, perhaps typical varieties, from different localities. In all possible cases, it is desirable that a portion of the gangue, or matrix, in which a substance is found, should accompany the specimen.

Frequently, a large and clumsy specimen may, by the aid of a hammer and a pair of cutting pincers, be reduced to a neat and select one. This requires great dexterity, as an unpractised hand is very likely to destroy, by a mistaken blow of the hammer, the very portion whose preservation is most desirable. Previously to the commencement of operations, therefore, the structure of the substance should be minutely examined, so as to observe in what direction the blow would probably take effect. Those minerals which possess a lamellar structure may be easily split in the direction of the laminae, but with great caution in the contrary direction. But the greatest difficulty is experienced when the substance is in delicate and friable crystals, occurring on a gangue of a hard and tough nature, as the first blow would cause the crystals to fall off, and yet make no impression on the gangue. In such a case, it is advisable to set the lapidary to work, who will, without much danger to the desired portion, separate therefrom the offending gangue. These suggestions, however, are perhaps unnecessary, as in most instances the dealer in minerals will have reduced his specimens as far as might safely be attempted.

The number of distinct species of minerals and their varieties is so immense, that even when the funds are ample, it must be a work of many years to form a collection whose number shall even approach to that which is known to exist. We would, therefore, advise the student first to direct his energies and resources to procuring one good average example of each distinct substance, rather than to accumulate a number of varieties of one species, whilst others are neglected altogether. The varieties may be added as opportunity offers.

Another excellent plan for the beginner is to purchase a collection already prepared, containing fair specimens of most of the principal common substances, and so to form a nucleus, around which to gather any acquisitions that may afterwards become desirable by his increased knowledge. Such a collection might be obtained at a very moderate price; the principal expense, and, let us add, the principal pleasure, would be experienced in adding to it such individuals as it did not contain, in consequence of their scarcity and costliness.

The Cabinet.

Before the learner has proceeded far in the accumulation of specimens, he will find it essential to procure a cabinet to contain them, and that without this his specimens would be an encumbrance and a source of annoyance instead of agreeable recreation. Scattered here and there, in an odd drawer, on the sideboard, occupying every available table, on the floor or the mantel-shelf, we fear that the unconscious specimens and their delinquent owner would meet with but little sympathy or encouragement from those whose hearts were not so devoted to science as to quietly acquiesce in such an infringement of household regulations. Besides this, infinite damage would result to the homeless specimens themselves, which would certainly be subjected to the daily dustings and sweepings that seem indispensable to a well-ordered apartment, but which processes would probably tend to reduce a finely pointed acicular crystal to an obtuse, a very obtuse, pyramid or prism.

The cabinet should be made of mahogany, never of cedar, because from that wood a resinous matter exudes, which, covering the specimens in the drawer, renders most of them in great part valueless. Many fine collections, both of shells and minerals, have been much damaged through being placed in cabinets made of cedar-wood; it being almost impossible to remove the clammy covering without destroying the specimens.

Should our suggestions as to limiting the size of specimens be followed, the drawers of the cabinet may be made all of the same depth, which, in addition to facility of arrangement, gives to the structure a neatness of contour highly desirable in everything appertaining to science. The cabinet should be enclosed in folding-doors, both to prevent the entrance of dust, which would detract greatly from the beauty of the treasures inside, and to secure those treasures under lock and key from the deranging and injurious effects of curiosity and rough or inexperienced handling. A cabinet of minerals or other objects of natural history should always be sacred to its possessor, who would otherwise be deprived of one of his chief pleasures, namely, that of exhibiting its contents to those who can appreciate or who will admire.

To contain objects of natural history, few cabinets will bear comparison with those produced by Mr. William Edwards, of High-street, Camden-town, whose excellent workmanship, long experience, and moderate charges, we must, at the risk of appearing invidious, recommend to the patronage of those who require such services.

In order to prevent specimens from being damaged by collision with each other when in the drawers, various plans have been adopted. In some collections they are placed on pads of white silk, separated by thin strips of black wood. This plan is more adapted to large collections intended for the public gaze, as at the British Museum, than for a small private cabinet. Occasionally cotton-wool has been substituted for the white silk, but this is very objectionable, as, on a specimen being taken up, the wool will frequently cling to some projecting portion, and its removal will cause injury to its fragile structure.

The best plan, in reference to private collections, is to place the specimens in card trays, fitting closely into the drawer. These trays should be rather larger than the average size of the minerals, so that there may be a white margin between each individual, serving more completely to isolate one from the other, and, at the same time, adding greatly to the chaste ensemble of the drawer. For the same reason, the slip of paper on which the name of the substance is written should be smaller than the tray. The locality of each specimen should be carefully added beneath its name.

Besides these separate names accompanying the specimens, it is advantageous to fasten running numbers to them with gum, and to keep a catalogue of their names and localities, correspondingly numbered.

Coal Oil as a Remedy.

Some months ago we published a communication from Prof. J. B. Turner, of Illinois College—and which had appeared in many agricultural papers—setting forth the virtues of Kerosene or coal oil, as a remedy for rheumatism, salt rheum, bruises, and some other complaints. We expressed our belief that it would be found a valuable remedy for the complaints named. We are glad to learn, that it has been tried in several cases of rheumatism and effected cures. The rheumatism is one of the diseases of this country, and a remedy for it is of very great value. We feel that those persons who have been relieved from this disease, by the application of coal oil, owe a duty to us, and to those suffering from the disease, to furnish the facts of their cure by the remedy named, for publication in this paper. Think of it! Should those who have suffered sleepless nights and painful days, and have been incapacitated from the performance of their daily labors by this disease, neglect when cured, to give hope to others similarly afflicted, that a remedy, easily attainable, at little cost, is at hand for their relief?

It has come to our knowledge that this remedy has been used in cases of sore throat, sore from colds, perhaps bronchitis—with great advantage, even effecting cures. If this be so, its value can scarcely be appreciated.

We again recommend persons afflicted with rheumatism, to try this remedy. Bathe the parts affected morning and evening, with the well—and dry—by the fire. The flavor of coal oil is not agreeable to man, but it soon passes away. Our own opinion is, that it is worth all the nostrums and patent medicines ever invented for the cure of rheumatism. —Oregon Farmer.

The Silver Mines.

Considerable excitement pervades the upper country relative to the newly discovered silver mines, and already a large number of claims have been taken up. Four mining districts have been laid out, and are known respectively as the "North Powder River District," "South Powder River District," "Grand Rondé Silver Lead," and the "John Day District." The claims embrace a quarter of a mile each, and are numbered as taken up. On the "North Powder River District" thirty-two claims have already been taken. An equal number of claims have been taken up in the remaining districts. To make sure of their claims some of the parties have had them registered in the County Clerk's office. On Saturday last, five claims in each of the Districts were thus registered. They stand in the names of A. J. Thibodo, Thos. J. Reiley, Edward Everett, Sam'l M. Baldwin, and H. Way. These gentlemen possess the means to work their claims, and should the assay of the mineral already taken out prove favorable, they will immediately commence operations. What with gold and silver excitements, we bid fair to have lively times.

Good for Working Men.

Owing to the large number of miners having left for the new mines, miner's wages in this county have increased, and drifters being scarce, are very readily engaged at \$4 per day and board.—There are a great many extensive drifting claims in this county that are paying rich, after good wages are paid, some of which are rented to companies at enormous prices.—Yreka Journal.

More Discoveries.

According to the San Bernardino Patriot coal, of a superior quality, and alabaster, of great purity, have been found on the Santa Ana River, in San Bernardino county. Gold, silver and copper have been found in promising richness along the Mojave, at different points.

The Collection.

NUMBER 3.

"The philosophic youth
To Nature's voice attends, from month to month,
And day to day, through the revolving year;
Admiring sees her in her every shape,
Feels all her sweet emotions at his heart;
While truth, divinely breaking on his mind,
Elates his being and unfolds his powers." THOMSON.

Whilst some seek for pleasures only amidst the gaieties of life,—in the "giddy mazes of the dance,"—in the exciting allurements of the theatre, or in the elevating pursuit of music in its different branches;—whilst others hope, on the contrary, by denying themselves all recreation, and devoting their whole time and thought to religious exercises, to obtain happiness in this world and peace hereafter; others, still paying due attention to moral and religious duties, and still enjoying a reasonable share of the gay and lighter scenes of life, find a calm delight in following with thoughtful eye the progress of the arts and sciences, or in investigating the admirable phenomena which are presented by the wide field of nature. To such, works of this nature may be of service in directing attention to the paths by which their favorite pursuit may be followed, with the fairest prospect of attaining interesting results.

But, whatever may be the importance of any particular study in a scientific point of view, there can be little doubt that but few would be found willing to devote their leisure hours to attaining a knowledge of any branch of natural history, were it not for the interest that is inseparable from the acquisition of a collection of specimens to illustrate the subject to which the attention is given. The chief object of some, in forming this collection, is merely to obtain such a specimen of an object or a substance as will serve to make them acquainted with its characters, and to render the experience so gained subservient to the interests and advancement of their adopted science. These are comparatively few. More generally a science is taken up for the excitement and pride of possessing specimens which are either remarkable for their beauty or for their rarity, and the attainment of a *unique* is in this case a primary object, on which time and money are lavished in abundance. Accordingly, we find that the value of an object of natural history varies greatly, just in proportion to its scarcity. A high price is frequently given for a specimen, if but few others are known to exist in the cabinets of the curious, and an enormously high sum for an object supposed to be the only one of its kind in existence; but should its locality be ascertained, a supply is thrown into the market, and its value is depreciated to a mere fraction of what it formerly possessed: not because its beauty or its scientific interest has fled, but because it is no longer to be considered a rarity or a *unique*. This spirit of emulation is of considerable benefit in many ways, and, if it be an error, it is but an amiable weakness.

Let the *scientific* motive, however, be what it may, it is certain that a collection of specimens is absolutely necessary to those who desire to study a branch of natural history; we will, therefore, offer a few remarks, which we trust may be found of use during the charming occupation of assembling together, from all parts of the world, illustrative examples of the mineral substances that enrich the earth.

On the Relation Between our Perception of Distance and Color.

The fact that a landscape appears more vivid in color, when viewed by the eyes brought into an abnormal position, as in looking under the arm, &c., is well known.

Some persons have attempted to explain this fact by the influence of an augmented pressure of the blood upon the retina.

In an easy reclining posture, where such pressure can hardly exist, I observe this heightening of tints with great distinctness, also by viewing the inverted image of the landscape by total reflexion through a rectangular prism, the head being in its natural position.

Dr. A. Muller with more probability has referred this appearance to the different accommodation of the eye for horizontal and vertical lines.

To me it seems that this effect is intimately connected with our perception or non-perception of distance. In gazing at landscapes, the ordinary habit of most persons, artists excepted, leads them to pay attention to the forms and distances, (which alone have a practical value as objects of observation), and to neglect the color, particularly those portions of it which are subdued. When now by any means the mind is prevented from dwelling on distance, it is thrown back on the remaining element, color; and the landscape appears like a mass of beautiful patches of color heaped upon each other, and situated more or less in a vertical plane.

(1.) A perpendicular position of the eyes reduces very considerably our perception of depth or distance, so that false estimates of it are formed by the eyes in this new situation. With the exception of objects in the foreground, all things seem to lie not far removed from the same vertical plane.

The reason is partly to be found in the fact, that while in normal vision our binocular perception of depth is obtained by regarding vortical lines, trees, &c., in vertical vision the

same objects, though instinctively sought afford us no information.

(2.) In normal vision with a single eye, there is certainly, in a binocular sense no perception of depth, nevertheless the mind occupies itself with the idea of distance, and if the objects are familiar there is no augmentation of color perceived. By inverting the image of the landscape with a rectangular prism the objects fall into almost one plane, are diminished in apparent magnitude, and the mind unable to trace distances through this maze, is forced to dwell on the mass of tints presented.

(3.) With the erecting or inverting telescope, in proportion as the objects viewed are divested of the idea of solidity or depth, can their more delicate tints be perceived. Objects, which in normal vision seem to us nearly without color, are best fitted for these observations; a bare pile of stones and dry mud viewed through a telescope appears often like a richly tinted water color drawing.

It would seem probable that if we could add to paintings of landscapes the element of distance, the mind occupied with this would no longer dwell on the richness of the tints. In confirmation, I find that colored stereographs of landscapes, which out of the stereoscope seem exaggerated in tint, when placed in the instrument no longer appear too highly colored.

From the foregoing considerations, then, it would appear that when the mind is engaged with the perception of distance, the presence of color is often overlooked; its absence may remain unnoticed from the same cause, for in uncolored stereographs of objects that are perfectly familiar to the observer, it will sometimes be noticed, that those articles which do not greatly differ in color from the tint of the photographic paper, are seen in the stereoscope with an approximation to their natural hues; upon withdrawing the slide from the instrument no trace of such tint is perceived. Objects that are free from lustre, as well known carpets, answer for this purpose. That this should be the case with the tinted photographic representations of white objects can be explained of course in another way.

[The chromatic effects here noticed by Prof. Rood are well seen in the ordinary camera and dark chamber. Thus the human countenance when not florid, presents to the unartistic eye few or no traces of pink or flesh color—but every one who has seen it in the camera must have observed with what distinctness the image is colored. The same is true of familiar landscapes, when seen inverted upon the screen in a dark chamber. Here the neutral tints which in nature are almost unnoticed by the common observer, stand out as distinct patches of color in the way so well described by Prof. Rood.]

CURIUS ACTION OF SILVER.—Professor Boettger states that if dry oxide of silver is moistened with essence of cloves, the mixture takes fire and the metal is reduced.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above pursuits, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of machinery and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2.80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Rooms 20 and 21, Government House, Corner of Washington and Sansome streets, San Francisco.

THE MINER'S COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores giving at the same time their density, color, specific gravity and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits and as a pocket manual or reference should be in the possession of every engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—(Morning Call.

A BOOK FOR THE MINES.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have not at length indicated its characters, and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—(Herald.

THE MINER'S COMPANION AND GUIDE.—In a recent notice of this invaluable work, we omitted to give some of its leading features of interest and value specially designed for our mining community and metallurgists. This book has been carefully prepared and published by the enterprising editor of the "Mining and Scientific Press" of San Francisco. It contains nearly one hundred illustrations, with three hundred pages of interesting and instructive matter, forming a neat little volume substantially bound, at the low price of two dollars. It is thus far the best mining work issued on this coast having complete treatise on veins and lodes, timbering of mines, manual of metallurgy, the geology of California, and the most important of all, many new and interesting methods for separating gold and silver ores, and pyrites together with a glossary of technical terms not contained in any other work. The miners of this coast will find this an indispensable hand-book. Every Californian should possess it.—[San. Bee.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, comprises seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work is the "Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved processes for separating gold, silver and pyrites. In the latter portion of it work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and doubt will meet with great sale.—[San. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary giving the definition of many technical terms, and a list of work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout our mining towns for its merits and lucidness. We earnestly commend it to those who are practically interested in bringing to light from Mother Earth hidden treasures.—[Union Temperance Journal.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
 Central, \$625 per share.
 Ophir, \$1000 per share.
 Gould & Curry, \$225 per share.
 Chollar, \$15 per share.
 Lucerne, \$20 per foot.
 St. Louis, \$4 per foot.
 Mount Davidson, \$60 per share.
 Mark Anthony, \$8 per foot.
 Louise, \$18 per share.
 Brailley, \$5 per foot.
 Sacramento, \$10.
 Shelton Co., \$3 per foot.
 Josephine, Flowery, \$10.
 West Branch, Flowery, \$7.
 Harrison, Flowery, \$12.
 Yellow Jacket, \$25.
 Exchange, East Comstock, \$40.
 Monte Cristo, \$5.
 Home Ticket, \$5.
 Silver Mound, \$35.
 Sunshine, \$16.
 Ohio and Buckeye Co. Argentine, \$12.
 Chimney rock, \$15.
 Dargen, \$10.
 Rich Co., \$3.
 Miller, \$12.
 Augusta, \$6.
 Spanish Co. Plymouth Ledge, \$6.
 Chelsea, \$8.
 Caney Ledge, \$25.
 King Charles, at Flowry, \$6.
 Edgar Co., Great Western Ledge, Helena, \$20.

Number of Shares to the Foot.
 Central, 12; issue, \$300 per share.
 Ophir, 12; issue, \$300 per share.
 Gould & Curry, 4; issue, \$500 per share.
 Chollar, 4; issue, \$300 per share.
 Lucerne, 1; issue, \$500 per share.
 Mount Davidson, 4; issue, \$200 per share.
 [Having completed all the requisite arrangements we lay before our readers a reliable list of prices of mining stocks of Utah.]

Five feet Mammoth Lode, Sold at \$70 per foot.

SALE OF MINING STOCKS.—Sept. 25th, 1861.—Pine Forest mining district:
 Pine Forest Co's Lode - \$1 per foot.
 Honan - 1 do
 McHenry - 1 do
 Eagle and Washoe Valley mining District:
 Bulls Lode - \$3 per foot.
 Sales 200 feet.

The Washoe Times furnish us with the following table of ruling prices of mining grounds in and about Silver City, known as the Devil's Gate District:

Dana	\$250
Caney	25
Independence	10
Gov. Nyo	25
Union	6
Ellsworth	10
Pride of the West	10
North American	25
Silver City	10
Wappola	10
U. S.	5
American	10
Dorance	5
Mt. Hope	5
Wane	5
Senorita	5
Gold Bluff	5

PACIFIC METALLURGICAL WORKS.

NORTH BEACH,

Are now prepared to reduce by contract, Gold or Silver Ores or Sulphure. Price of reduction will be as low as the charge of similar establishments in Europe or in the States, thereby saving freight, insurance and interest.

BRADSHAW & CO., Agents,
 Cor. California and San.

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco. Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc.
 The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing.

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000
 IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that purpose, by resolution of the Board.
 The Books of Subscription are open at the office of Piche & Bayerque where the required first instalment of 10 per cent. will be received.

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING,

..BUT THE BEST FOR..

MANUFACTURING CLOTHING

..AND..

OTHER HEAVY WORK.

SAN FRANCISCO, JUNE 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cassimere and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them cannot be surpassed.

Various styles of Machines have been employed on the above materials, but the Wheeler & Wilson is preferred.

DONALD McLENNAN,
 Proprietor of the Mission Woolen Mills

A. ROMAN & CO.

Booksellers, Importers, Publishers,

507 MONTGOMERY STREET,

SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 577 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 360 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc., Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Rudimentary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lam-born.

The Discovery and Geognosy of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Dissertation on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supersede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silver-smith, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

Yours, truly,
 G. W. HAMMETT, A. BALDWIN,
 M. CROGER, CHARLES MCGARRON,
 D. R. MEACHAM.

June 12th, 1860.

MR. STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harney's field, and I am pleased with its performance. The cam wheel power over that of the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of coggings-bearings and locking, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,

ELAM BROWN.

PACIFIC, June 23, 1860.

MR. STANDISH—Sir: This is to certify that I have operated one of your Mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife in clover, or cut any grass.

Witness: Washington A. Wilson, W. T. Hendrick.

LAFAYETTE, June 27th, 1860.

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

Malis

J. B. BEERS

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....NOV. 23, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

Monte Diablo Coal Mines.

We present this week our numerous readers with geological diagrams, and a synopsis of the coal bearing strata of Monte Diablo, which has been carefully and correctly surveyed by Mons Auguste Remond, a promising geologist of this State. In our issue of August 24th, Vol. III., No. 22, an essay and full description, together with a comparative analysis, appeared in the MINING AND SCIENTIFIC PRESS, in which the author quotes from the PRESS, Professor Blake and Mr. Heusch, who have each been to see these mines, made notes and reported them accordingly. We have neither space nor time to reiterate what has been often said by the Press of this State, but confine ourselves to the lithographed diagrams enclosed, as a Supplement to the MINING & SCIENTIFIC PRESS. The acquisition of coal mines to the Pacific States is of too great an importance to be lost sight of,—the price of coal has been materially reduced since their discovery. We hear accounts from Washoe and several counties in this State of newly discovered coal fields. The following description relating to the signs and letters will serve as an explanation to the diagram. We are under obligations to the author, who, we understand, has in course of preparation a pamphlet relative to these mines, which will shortly appear. He informs us that he has collected more than two hundred species of shells and fossil remains, some fifteen or twenty of which are entirely new species, never he-

ore described. These remains will have to be sent to Europe to be classified.

No. 1.

Geological Section Across the Coal-Bearing Rocks, and Mount Diablo, from the San Joaquin River as far South as Alamo. Length 20 miles.

(This geological section being taken in such a way as to show all the different tertiary strata and their relative positions is not on a straight line from north to south, but includes a surface of ground which is several miles wide and about twenty in length. The principal strata are here represented in their natural position.)

- A San Joaquin River.
- B Alluvial soil of New York Plain.
- C Beds of volcanic tuffe overlaying conglomerate and gray sandrock. The upper bed *a* is made of minute fragments of pumice stone (pozzolana) agglutinated by a red cement, colored by peroxide of iron; the lower bed *b* is a sort of cemented white volcanic ashes.
- D Series of fossiliferous strata of sandstone within thin beds of conglomerates: fossils: *venus, ostrea, mytilus, lutraria, pecten*, sharks' remains, and silicified trees.
- E Sandstone strata with beds of shales and small seams of coal.
- F Coal-bearing strata, consisting of a succession of white sandrock with shales and five layers of coal, three of them workable. The average thickness of the coal beds is three feet and six inches. Altitude: 1,200 feet.
- G Thick beds of conglomerates made up of debris of plutonic and sedimentary rocks: they overlay sandstones with here and there an occasional layer of impure limestone.
- H Magnesian sandstone and layers of shales.
- I Concretionary shales (bluish clay) with thin strata of nodular bituminous limestone.
- J Deposit of magnesian limestone.
- K Sandstones resting on serpentine rock; metamorphic in some places.
- L Diabase rock.
- M Metamorphic slates.
- N Probably serpentines and metamorphic sandstones (?)
- O White and red sandrock, analogous to *F*.
- P Perpendicular fossiliferous sandstones corresponding to *D*, but not so rich in fossil shells. *a* Conglomerate of pebbles and broken shells. *b* Oyster bed some feet thick, capping the summit of the hill; it is entirely made up of large *ostrea titana*. *c* Conglomerate. *d* Decayed sandstone with *natica*. *e* Decayed sandstone with imperfect fossil shells. Altitude, almost 2,000 feet.
- Q Strata of sandstone with here and there a bed of conglomerate.
- R Sandstone with occasional layers of calcareous tuffe. (The sedimentary formations south of Mount Diablo, could be joined by imaginary lines with those north of this mountain.

No. 2.

Theoretic Ground Plan of the Tertiary Hills, Showing Their Relative Positions.

- A Road to Pachecoville, Oakland, etc.
- B Road to the top of Mount Diablo.
- C Road to Peacock Mine and Cumberland Mine.
- D New road from Cumberland and Black Diamond mines to New York.
1. Peacock Mine.
2. Cumberland Mine.
3. Black Diamond Mine.
4. Clark's Mine.

Direction of volcanic forces.

Line of demarcation.

Hills pitching north and north-east.

Hills pitching south and south-west.

No. 3.

Section D Amplified, from North to South.

1. Decomposed gray sandrock and sandstone, with silicified wood (oak and pine trees).
2. Loose sandrock with *lutraria, pecten, mytilus* and *ostrea* (new species).
3. Fine conglomerate.
4. Sandstone.
5. Conglomerate.
6. Oyster bed two feet in thickness; this layer is entirely made of *ostrea titana*; some of them are more than one foot long and weigh ten or twelve pounds. Corresponding with the oyster bed *Pb*, south of Mount Diablo.
7. Decayed sandstone with fragmentary shells.
8. Thick beds of sandstones with conglomerates.
9. White shales of indurated clay.
10. Gray decayed sandstone.
11. Fossiliferous sandstone.
12. Sandstone with large *pecten*, sometimes more than nine inches, and *mytilus*, four inches large.
13. Sandstone with fragments of broken shells.
14. Sandy and clay shales with small seams of coal and gypsum.

No. 4.

Section F Amplified, from North to South.

1. Ferruginous sandrock with shales.

2. Layer of bituminous lignite (coal).
3. White sandrock with shales. Thickness: 239 feet.
4. Bituminous lignite.
5. White sandrock and shales. Thickness: 30 feet.
6. Bituminous lignite.
7. Sandrock and shales. Thickness: 126 feet.
8. Bituminous lignite (coal).
9. Sandrock and shales. Thickness: 74 feet.
10. Bituminous lignite (coal).
11. Sandrock. Thickness: 130 feet.
12. Conglomerate.

Average thickness of the coal beds: three feet six inches.

No. 5.

Ground Plan of the Range Facing Mount Diablo.

No. 6.

Theoretic Section to Show how to Strike a Coal Vein.

- | | |
|-------------------------|------------------------|
| 1. Level. | 4. Coal-bearing rocks. |
| 2. Shaft. | 5. Debris. |
| 3. Outcrop of the coal. | 6. Coal beds. |

No. 7.

Theoretic Section to Show the Probable Position of the Strata Beneath the Valley.

- A-B Level of the ocean.
- C Alluvial soil.
- D Fossiliferous and non-fossiliferous strata.
- E Sandrock and layers of coal.
- F Metamorphic sandstone.
- G Plutonic rocks.
1. Outcrop of coal beds.
2. Tunnel for extracting coal.
3. Shaft.
4. Shaft cutting all the strata superior to the coal, and also the coal beds; impracticable.
5. Coal beds in their natural position, not acted upon by volcanic upheaval.

Mining Companies and Associations.

The mining companies and associations in this State, who wish to pursue a systematic course in their operations, can have no objections in furnishing us with such details and facts pertaining to their projects, as may prove advantageous to them and interesting to our readers. The benefits accruing from such publications have a tendency to awaken an interest among foreign capitalists to invest in well established institutions. In a recent issue we illustrated the "Mina Prieta," situated in Sonora, Mexico, said to be one of the richest mines in that district—and why cannot other companies do the same? Similar mining journals are furnished with such matters, and it is gratifying to its stock and share holders to know and understand what they have to hope for. We labor for the cause of mining and expect that the many companies will not withhold such patronage or information within their gift.

United States Branch Mint Statistics and Notices.

We give this week some interesting facts connected with the above office. Elsewhere we have made certain statements, which are mainly based upon the following statistics for the past two months.

The following new notice, establishing an extra charge on bullion deposited, has been posted up; those depositing will act accordingly:

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

Deposit for October, 1861.

Gold, gross.....oz.	66,217.40
" Valuc.....	\$1,244,832.09
Fine gold.....oz.	21,392.73

Coinage for October.

Gold.....	\$1,130,000
Silver.....	109,000

Total Coinage.....1,239,000

Increase in Gold deposited, over Sept.....oz. 10,018.03

Decrease in silver.....oz. 7,558.25

Coinage for September.

Gold.....	\$1,220,000
Silver.....	68,000

Total coinage.....\$1,288,000

SUMMARY OF MINING NEWS.

To Miners and Mill Owners.

We respectfully request all persons interested in the Mines, Quartz Mills, or in any prospecting expedition; also the Records of the different mining districts to forward to us all times, such information concerning the condition etc., the mines and hills in their vicinity, and description of localities, as they may think will prove interesting or useful to a public, for publication. Records of mining districts will oblige by sending us their address.

CALIFORNIA.

Trinity county.—The Douglas City Gazette, one of our abtact exchange speaks as follows of its mining operations in its county: During the last week we have been down the river, as far as the North Fork twenty miles below this place. The present lack of water from the small streams makes the supply generally derived, gives times a rather dull appearance as mining is concerned, although a considerable number of miners are at work along at the various points. The road of Brown's creek, owned by Messrs. Gardiner & Co. are preparing to build a high dam across the river, convey the waters of Brown's creek to the high benches above Evans' bar. The span will be about one hundred feet high above the bed of the river, and the length of the dam about five hundred feet. Brown's creek an excellent water privilege, and the flume and ditch when completed will be valuable property. At Evans' bar a number of companies are at work, which seems to have fallen in point of both population and business since we were there before. There is no abode at the dam at present, and the miners at this point do their trading either at Evans' bar or Junction city three miles below. At this point McCampbell & company have a dam across the river which conveys the waters of Soldier's creek to the claims below the dam. We took a glance at the claims of our old friend, Jas. Briggs, which are paying very well at present. We were shown about sixty feet long by twenty feet wide, from which seven hundred dollars had been taken up, which we present seemed it had a slight recollection of our last winter's experience in "Pan-wicket" so put that lien out of our head. At Soldier's bar opposite, and on the river between this point and Junction city, several companies are at work, with what success we did not learn. The principal dependence for fuel along the river, is on water wheels, a very unsafe species of property, we know to our cost. Between Douglas city and North Fork there are six good sluice boxes of water. Junction city seems to be a flourishing little place, which has improved greatly since we last visited the locality. We noticed several new buildings either in course of erection or just completed, which gives the town a thriving appearance. Several of our old acquaintances are engaged in business here, and seem to be doing well. At Evans' place, the Trinity Store, is about a mile below. At this point a bridge has just been built across the river. Below the Trinity store are the hills where there have been some of the best placer mines of the best little mining camps we have ever seen, and from its location is fitted many to be a noted place. The roads to New River, East Fork, North Fork, Rattlesnake and other places branch off at this place, which secures great deal of trade from those places. The principal mines in the vicinity of North Fork are in the adjacent hills, and as water is scarce it presents not much of a doing. There is but very little water in North Fork at present, and we are aware by some of the old residents who we present seemed it had the lowest that was ever known. The low bars in the vicinity are so low that they cannot be worked successfully during the winter season, and companies are at work at Independence, Rocky and Honest Bars, who pay good pay. The range of country from Evans' bar and North Fork, a distance of about ten miles, looks to us as though it should afford employment to at least four times the number of men who are now at work. The drawback is the want of water, which could only be obtained in the river itself. We believe that a ditch taken out of the river and conveyed along the mountainous bars, which would afford water at the season of the year when they could be worked to the best advantage, would be a paying operation for many years.

For some time past, Messrs. Hough & Hough, who have been purchasing large amounts of dust at this place, have noticed that their dust has fallen short of the amounts purchased. Last Saturday a Chinaman from whom they had purchased some dust, and who was suspected of having sold them bad dust, called at the store and offered some for sale, which they took and at once proceeded to test its genuineness, when an ingenious fraud was at once discovered. Upon taking the dust in nitric acid evidences of zinc, copper, and antimony were discovered. It seemed that they had filled up China colors or cash, and used it with fine dust in the proportion of about four dollars to the ounce. The fraud was discovered, and the Chinaman was quickly and afterwards hurried away, when its appearance was that of dirty quicksilver dust. The Chinaman was seized, and suspecting something wrong he slipped a paper containing about four ounces of the same kind of dust into the hands of another Chinaman with him, who at once made off for Texas Bar, where he was followed by Mr. Hough, and the dust taken from him.

Colusa county.—The Courier gives the following resume of its mining items: Availing myself of a few days leisure I have been making a survey of our mining, endeavoring to inform myself as to the true condition of the men at work, and their present and future prospects. As observations may be of interest to your readers I will endeavor, in as plain a manner as possible to give you a sketch of them. I am sorry to say that there is less men to work in this district than at any former time, consequently less gold being dug. The cause of this is to my mind very evident; and as many of our business men and others who should know, are puzzled to assign a reason for the great change which has taken place in this once best mining district of California, my observations may perhaps open their eyes to a fact which they do not wish to see. Columbia mining district is in a time boulder range. Here we have no bottom or bed rock, and an easy work as in the boulder ranges. Now, how far it has been done? On Gold Hill nothing remains but a huge rock on the surface having disappeared long since. A very few men are at work on small white leads of gravel which run down among the boulders, but most of this having to be winched, it costs nearly as much as it is worth to get it up and wash it. There is some ground left which will pay for a full race. On French Gulch and vicinity there is a good number of men at work, making, on an average, wages. Here, too, the surface of the ground, and the dirt is either carted or winched from among the boulders. Some ground has been opened during the year on the west side, the old saw mill site, by means of some small flume which have been built—it will pay well for the outlay and last perhaps two years. There is a deal of paying ground between French Gulch flume and the Columbia flume, which will be opened, and will pay, provided the Columbia flume, which is now being lowered, is ever completed. As for Columbia flume, without the flume, the flume is a waste of money, and it is, by carting from down amongst the boulders, from fifteen to twenty miles to the water, thereby costing as much again as it would if they could get into the flume—in another year or two at the furthest it will be mostly abandoned. There is eight claims being worked on the Gulch at Bensonville, they are from ten to twenty-five feet deeper than the flume; four to ten men work on each claim, and they are making from ten to twenty-five dollars to the barrel. These boulders, these boulders, these boulders, but the present mode of working. Below this, on the west of the flume, there is a large amount of ground which would pay well provided the flume was finished. On the flume I saw six men blasting, and one soldier porter. The work was commenced in June last. There is completed

twenty-five rods of the cut for the flume, and twenty rods in, leaving about fifty-four rods of blasting to do through solid rock, averaging about twenty-two and a half feet deep. There has been, up to within a short time, from eleven to twenty men employed. They have also striped about two hundred feet preparatory for blasting. As near as I could ascertain, this is all the work that has been done. From the deep cut up, it is estimated that one-fourth the labor will complete it, which is in a distance about three-fourths of a mile. The thing is very certain, without some arrangement is made to induce the Flamingo company to put on more men, and hurry on the work, Columbia Gulch, and all the claims around it, will be deserted before completion. From Bonnell's up to San Diego Gulch there is not twenty-five men at work, and they are working at a great disadvantage, being obliged to hoist their dirt from twenty to forty feet, from amongst the highest kind of boulders; notwithstanding the old Hildreth, or Bonnell claim, the Columbia, the Tom Key claim, and the others in this part of the Gulch are paying good wages. From here up there is only a number at work, but owing to the flume being so near the top of the ground it costs nearly as much to wash the dirt as it is worth. Knapp's ranch looks well, though here again the top is fast disappearing. I do not believe there is a spot in California where more dirt has been washed, in the same length of time than here. The top, as deep as the tunnel will allow, on the famous Black claim is all gone. Mr. Black with his usual energy has contracted for the running of another tunnel, about thirty feet deeper than the old one. All of the claims are at work, and more being opened. Here too unexpectedly large boulders are showing themselves—the owners are all making money, and some of them fortunes. Correll, Matcett, Spring and Experimental Gulches, are worked out, at least for the present, although with cheap water a good deal of ground would be opened on each of them that might possibly pay wages. Three-pipe Gulch is worked out to near Summit Pass. Here the owners of the Tom Key claim have been taking out large sums of money. Fox Nigger and Wolfe gulches are also worked out, although they have been so famous. The owners of the Tom Key claim have been taking out large sums of money. I have mentioned all the prominent locations in the district. This being the true state of things, who can wonder at the lack of business and the depreciation of property in Columbia. On gulches, flats and ravines, where hundreds of men two or three years ago were at work nothing is now seen but deserted cabins. The miners on which all but one of the claims are now have left. Two things only will save Columbia Mining district, namely, railroads and cheap water. I am glad that I can say a good feeling is now being cultivated between the miners and the water company. Since the mountain engineers were paid off, the collectors and all connected with the company, have shown a much more liberal disposition. There is a scarcity of men to hire in the district, all those who had no claims having left, and from what I can gather, as many as can get away will leave in the spring for new mines.

Sierra county.—At Newark, says the Messenger, there is more rich drift breasted out than there has been at any former period. One company, Dr. Porter's, has the largest pile of paying gravel we ever saw in any mines in this country—all of which prospects as high as two dollars per car load, and some of it reaches eight dollars and upwards. In the advent of a plentiful supply of water, some \$40,000 will undoubtedly be cleaned out of this extensive claim. The Dr. is entitled to the credit of having remarkable perseverance and enterprise. Newark will be able to make a good report of her mines. During our recent trips about the mines in this section we noticed the saw mills were all running briskly, indicating that more than ordinary preparations for mining are going on this season, and we may expect a large harvest of gold in Alturas next spring. The Marysville Express says that the up-country roads are horridly bad, the snow being three feet deep, on an average, at La Porte on Saturday. The stage is now unable to go farther than the Columbus House, sixteen miles below La Porte. The Stanford Hill, eighteen miles from Marysville, was, on Sunday covered with snow, an unusual thing even in the stormiest weather. The top of the Downville stage which arrived the same evening had snow on it four inches deep.

San Bernardino county.—We learn from the San Bernardino Patriot that Mr. Lane, of the Mohave, that a gentleman from these mines lately passed his place en route for Los Angeles, and reported that the company which left that place two months ago had all safely arrived, and commenced operations on their lodes. An astrava was built, and from one clean-up the sum of \$1,500 was realized; and it was found that the deeper they sank on the lode the richer it became. New discoveries were being made almost every day, and some of which are thought to be much richer than the old ones being worked. These mines are on the divide of the north-westerly direction from Fort Mohave, and about six miles from the banks of the Colorado river. It is the intention, we learn, of some parties on the Colorado, to run a steamboat from the mouth of the river to these mines, thereby opening water communication to San Francisco.

WASHINGTON TERRITORY.

The information from the Salmon River Mines is full of interest. Stories are told of the richness of the gold discoveries there which are well calculated to challenge belief. According to the statements of well known and responsible persons, the richest mines that have ever been found, at least upon this coast are those of the Salmon river section. Some fifteen hundred miners, at last accounts were at work, mostly near the head of two streams called Slate and Meadow creeks. All were doing so well that two once diggings were rejected. Claims were not retained which would not realize more than that per day, which is not to be wondered at when men could pan out several five dollars a day in hill prospects. To what extent these mines are worked during the winter it is difficult to say. It will depend upon the character of the season. An open winter as it is termed, will enable a good deal of work to be done, for miners are going to remain there at all events, with the hope of being able to work some of the time. The last information from these states the weather was cold, and that there was snow to the depth of three inches on the ground. If that was the condition of things three weeks ago it does not argue very favorably for the prospects of winter operations. It is undeniable that the intelligence which is brought to us by every arrival from the various gold fields east of the Cascades and Blue Mountains, is creating a great sensation among our people. The fever is increasing daily. Everybody and his wife talks of going to the mines in the spring, when we suppose there will be a general exodus to the mining region. We imagine that it is hardly worth while to attempt to advise our farmer friends that by remaining at home and attending to their farms they will be more benefited in the end. That where flour is twenty dollars a barrel and bacon twenty cents a pound, they have a chance if they take advantage of it by preparing in time. But we apprehend that our agricultural interests will be very much effected, if not suspended for a period, notwithstanding our advice, for the gold fever treats all alike. It has been thought that there would never be another 49 on this coast. But present appearances indicate that there is a new mining operation in progress, and that it is not unlikely may be re-enacted here. The country will undergo a great change. Towns will spring in the interior as if by magic, and every department of business be stimulated to the fullest extent. We will have a population that shall develop the extraordinary resources of our section of the Pacific coast, which only requires the application of proper labor to make second to none elsewhere. The year 1862 will mark an era in the history of Oregon, which will be full of great and successful mining, calculated to give distinction and character to the State, and afford infinite prosperity to our people.

Mining Companies and Associations.

Office Dios Padre Gold and Silver Mining Company, 215 Front street, San Francisco, September 26, 1861.—Notice is hereby given that an assessment of one dollar per share on the capital stock of this company, was levied this day to be paid in installments at the office of the company as follows: Twenty-five cents per share on or before the 24th of October proximo, and fifty cents per share, on or before the 24th of Nov., 1861. Shareholders will take notice that delinquent stock will be proceeded against in strict conformity to law.

By order of the Board of Trustees.

JOS. P. NOURSE, Sec'y.

St. Louis Gold and Silver Mining Company.—Notice is hereby given that the Board of Trustees of the St. Louis Gold and Silver Mining company have, this 15th day of October, 1861, levied an assessment (for completing their audit) of two dollars upon each share of the capital stock of said company, payable to the Secretary, at No. 40, Montgomery Block, San Francisco. By order of the Board of Trustees.

J. H. BREWER, Secretary.

Office of the Cole Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cole Silver Mining company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent on the capital stock of the company, being fifty cents per share, payable on the 15th day of November to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.

J. B. COFFIN, Sec'y.

Office Dios Padre Gold and Silver Mining Company, 215 Front street San Francisco, October 29th, 1861.—A meeting of the stockholders of the Dios Padre Gold and Silver Mining Company, be held at the office of the company, on Saturday, November 10th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 16th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city. By order of the Board of Trustees.

JOEL F. LICHTNER, Secretary.

Office Gould & Curry Silver Mining Company, November 6th, 1861.—Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which be made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HINGINGS, Secretary.

Office Crown Point Gold and Silver Mining Company, 321 Front st., San Francisco, Oct. 28th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

Office Norman Silver Mining Company.—Notice is hereby given to all stockholders in the Norman Silver Mining company, that an assessment of fifty cents upon each share of the capital stock of said company was duly levied on the 5th day of November, 1861, and is payable on or before the 10th day of December, 1861, to Chas. Longdon, at Virginia City, N. T., or to the Secretary of the company, at No. 40 Montgomery Block, San Francisco. By order of Board of Trustees.

J. H. BREWER, Sec'y.

Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 10th of December next, at the office, as above.

J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 28th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City; or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco. By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary.

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.

All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOSEPH S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty-six or thirty days from date, to the Treasurer of the company.

By order of the Board of Trustees.

JOSEPH S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees.

HENRY S. HUDSON, Sec'y.

Office Chollar Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the Stockholders of this Company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

W. B. DEAN, Sec'y Chollar S. M. Co.

Notice.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the various mines known as "Alma Rica," "Guadalupe," "Fortuna," "Santa Cruz," and "Nacimiento," situated near San Antonio, Lower California, Mexico. CHAS. J. DUPRAT, EM. LEYA, DUPRAT, SCHMIDT & CO., CHAS. KRAFT & CO., La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California. For further particulars respecting the above named mines, inquire of JOS. J. DUPRAT, 423 Washington street.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN PATENT AGENCY OF MESSRS. MUNN & CO., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.
[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

Imports from January 1st to September 15:			
Anthracite, tons	16,903	Sydney, tons	11,304
Cumberland cks.	1,144	Japanese tons	25
English, tons	14,165	Vancouver I. tons	4,536
Chili, tons	9,135	Coast, tons	11,384

The sales of 3000 tons Anthracite, to arrive, which occurred some little time since, and were not made public, are the only transactions of moment which have come to our knowledge. They were effected at \$18 @ 19 7/8 ton, with some slight resales at \$20. Our quotations give a true index of the market.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths fine	3cts	per oz.
" from 300-1000ths to 750-1000ths fine	7cts	"	"
" " 750-1000ths to 950-1000ths "	14cts	"	"

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges a in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same a in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge of 1/2 per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register as most congruous with the physical aspects of the material but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California. —By recent additions to the extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.
We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stampmills and dies of iron, which is imported by us expressly for this purpose—its peculiar business making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at McCall's mill in this city.

Knott's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smit Mills; Roller Fronts; Wind Mills, of Hunt's, Johnson's and Linn's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.
Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER.

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.
The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXPERIENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be slid, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up without removing belt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the field, when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing.

CHAS. DUVECK.

Billiards, Fine Liquors and Havana Cigars

LYCEUM BUILDING,

Cor. Montgomery and Washington streets.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS!

The undersigned, having had great Experience and Facilities for carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

WILLIAM A. DURKEE,

At A. Kohler's Piano and Music House,
np11 Sansome street, between Clay and Commercial, up stairs.

MARKET STREET RAILROAD

DURING THE WEEK CARS RUN FROM SAN FRANCISCO TO MISSION AND WILLOWS:

FROM MISSION. From 6½ A. M. to 11½ P. M.
Connecting with the Hayes Valley Car and Lone Mountain Omnibuses, from this date.

ON SUNDAYS AND FEAST DAYS—

A new set of large and convenient cars will be added for the accommodation of the public.

F. L. A. FIOCHE, Trustee.

A SPLENDID OPPORTUNITY.

AGRICULTURAL MACHINERY.

As I have taken, for five years, a large portion of the State Prison Labor, for the sole purpose of manufacturing

AGRICULTURAL IMPLEMENTS AND CABINET WARE

I offer for sale, at a Great Sacrifice, in order to close out my present stock September First, 1861, the following articles:

TWELVE-HORSE STEAM THRESHERS;

C. M. RUSSELL'S EIGHT AND TEN-HORSE THRESHING MACHINES.

J. A. PITT'S GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND

TWELVE-HORSE POWER, with all of C. M. Russell's Latest Improvements;

HAY PRESSERS, REAPERS AND MOWERS;

EXTRA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE

RAKES.

All of the above goods will be sold at the Lowest Prices, either for Cash, or on approved paper at a low rate of interest.

THOS. OGG SHAW,

33 Sacramento Street.

Retrospective View of Our Resources.

The prophecies, hinted by some of our would be philosophers, that our gold yield drop off and silver supply the deficiency, have thus far failed. On the contrary our gold yield has been greater this year than any former.—New placer diggings are daily reported, and are being developed. The mines in Washington Territory and British Columbia have added materially to the gold product, and if one half of what has been stated of their reputed richness, it will double or triple itself in the next year! The winter will for a time check the operations in Washoe, and we are satisfied with its beneficent results thus far; we have had steady transportation of silver hors and ore from that quarter. The new silver discoveries in the Humboldt district will greatly augment the silver yield henceforth. Important operations in Mexico and Lower California are now being completed, and will add materially for the development of our mineral resources.

The World's Fair Again.

At a meeting held in the 4th District Court rooms on Friday evening, at which but few of the general committee were present: the reports from minor committees were heard. Mr. Blake notified the meeting that he had done all to ensure an appropriate exhibition of California mineral specimens, and that he would leave on Saturday (to-day) for the Empire of Japan, and by the time that the Fair would begin he thought that he could attend the same. Little or nothing has been done by the rest of the committee. A. H. Meyers, on Agriculture, has gone to Washington D. C., to have his appointment secured. We fear much if California can be represented in this mammoth affair, at least present indications prove so. The leading men in this State who might do much towards this project are intact. We hope sincerely that the present officials, who have charge of the State cabinet of specimens, will present it at this fair.

Mining Machinery.

Although the season is far advanced for shipping mining machinery and implements, yet are our foundries busily employed in filling their many orders for different parts of this State, Nevada Territory, Mexico and British Columbia. At no period in the history of this State, has there been such a rush for crushing mills than the present year. An important drawback has materially checked some of our foundries to prosecute their work on account of the scarcity of pig iron, which we hope they will not be subject to again. They should club together and have it shipped to them regularly from the East, and deprive the heartless speculators from enriching themselves at the expense of our home producers.

Steam Ditcher.

Mr. Fletcher, the ingenious inventor of the above machine, will complete his Steam Ditching Machine this week. The frame work as well as the machine and iron work is all completed, he is only waiting the finishing of an engine. It will prove by far the largest agricultural implement on record, and is acknowledged by farmers to be invaluable.

Immense Pump.

The Vulcan Foundry are constructing a very large pump for the Allison Ranch Mining Company. They have recently shipped a very large spiral boiler, twenty feet long to the same company.

A Grass Valley Invention.

A recent number of the *Scientific American* contains the following notice of a Grass Valley Invention, recently patented by L. F. A. Legouge of Boston Ravine:—

QUARTZ CRUSHER.—This invention consists in the arrangement of a reciprocating cradle, in combination with a series of stampers, in such a manner that, by the motion of the cradle, the stampers are caused to act on the quartz or other substance to be crushed. It also consists in arranging the stampers by means of pins and cross bars in the cradle, in such a manner the same are allowed to rise but prevented from coming down beyond a certain point; and it further consists in combining with the cradle and stampers a box containing stones or weights in such a position that said box and weights form a counterpoise to the stampers and facilitate the motion of the cradle, at the same time increasing the crushing power of the stampers.

Coal in Amador.

The Amador Dispatch calls attention to the fact that coal of an excellent quality for manufacturing purposes can be cheaply obtained in that county, and says that Messrs. Hall & Harron, of the Lone City Flour Mills, have opened a vein for their own use which affords a variety of coal which burns freely, leaves no cinder, though much ashes, and is of a light brown color, not so heavy as anthracite, and is found in a vein six feet thick. A tunnel was run to the length of 250 feet to reach the coal.

IRON STEAMSHIP.—The Government has contracted for the building of an iron steamship at Philadelphia. It is to be armed with sixteen of the largest rifle cannon.

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly in his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH,
GOVERNMENT HOUSE,
SAN FRANCISCO.

N. B.—T. R. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will hereafter transact all business pertaining to patents for us, at the patent office in Washington city. For instructions and the new law regulating patents, we refer the inventor to the above.

Miners, Inventors, Agriculturists, Capitalists and Mechanics, will find it to their advantage to subscribe for the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

J. SILVERSMITH, Publisher,
PATENT AGENT AND SOLICITOR, San Francisco.
Address: Lock Box, 537, Post Office, San Francisco, or Wells, Fargo, & Co.

THE FUNERAL

GENERAL E. D. BAKER.

The officers of the Army and Navy of the United States.
The Military of the city of San Francisco and State of California.
Officers and Soldiers of the War with Mexico.
The Governor and State Officers of the State of California.
The Chief Justice of the Supreme Court and Associate Justices.
Circuit and District Judges of the United States Courts and their Officers.
Judges of the District and other Courts of the State of California.
The Governor elect and Members and Members elect of the Senate and Assembly of California.
Governor and State Officers of the State of Oregon.
Governor and Officers of the Territory of Nevada.
President and Board of Supervisors of the city and county of San Francisco.
Civil Officers of the General, State and City Governments.
The Clergy of the city and State.
The Bar of the city and State.
Surgeons, Physicians, and the Medical Societies of the State.
The Fire Department of the city of San Francisco and the several cities of the State.
The Society of California Pioneers.
The German Benevolent Society.
The Hibernian Benevolent Society.
The Slavonic Mutual Benevolent Society.
The Felian Brotherhood.
The Society of Friends of Ireland.
The Society of Sons of the Emerald Isle.
The Society of San Francisco Verein.
The Society of Turn Verein.
The Society of Pacific Saengerbund.
The Society of Schutzen Verein.
The Society of Mitracht.
The Society of San Francisco Harmonio.
And all other Military and Civil Societies and citizens of the States of California and Oregon and the Territory of Nevada are invited to unite in the funeral solemnities of Gen. E. D. Baker.
Each Society and Association will report through its Marshal to the Marshal-in-Chief, Col. J. D. Stevenson, without delay. By order of
EDWARD STANLEY,
H. F. PERKINS,
Committee of Invitation.
J. D. STEVENSON, Marshal-in-Chief.

UNION IRON WORKS (ESTABLISHED IN 1849.)

N. E. Cor. First and Mission streets, San Francisco.

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the last twelve years, during which time new and extensive Buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS, MACHINERY AND CASTINGS,

Of every description, on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Powers, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work, Steamboat Repairing and Blacksmithing, etc.
STEAM ENGINES BUILT AND REPAIRED.

Resides the extensive assortment of Machinery Patterns, attention is called to the new and beautiful designs for Building Castings, Iron Fronts Columns for Stairs, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, Etc.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & G. M. WOODWARD'S PATENT.—This Pump is used for supplying Steam Boilers, Mills and Public Buildings, with water. In case of Fire it is arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the Discharge Outlet. It is suitable for both Maritime and Mining purposes, being used on nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED.
PETER DONAHUE, Proprietor.

OILS AND LAMPS BY LATE ARRIVALS.

STANFORD BROTHERS HAVE RECEIVED

A GREAT VARIETY OF COAL OIL LAMPS of every style of BURNER known to the trade.
BRACKET LAMPS AND SIDE LAMPS with the largest burners in use.
PARLOR AND STAND LAMPS—An endless variety of Patterns.
CHAMBER LAMPS AND HANDLE LAMPS—Very cheap; may be carried about.
CHANDLIER'S AND LANTERNS.
LAMPHOUSE LAMPS OF ALL KINDS.
COAL OIL AND CAMPHEN WICKS.
CHIMNEYS, SHADES, GLOBES—Of every size, style and finish.

200 BARRELS SPERM OIL—At a lower price than ever before sold in this city.
100 BARRELS LARD OIL—Of our own importation.
600 TUBS RAPE SEED OIL—In original packages.
100 BARRELS BOILED LINSEED OIL—guaranteed pure and free from fish oils.
400 CASES DOWNHILL'S KEROSENE.
800 CASES COAL OILS—At the very lowest market prices.
1,000 CASES CHINA OIL—In 2½ gall. tins.

We feel confident in assuring our CUSTOMERS and the TRADE generally, that they will find our assortment of LAMPS and LAMP STOCK, as well as of OILS and all kinds of BURNING MATERIALS, the most complete that has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms, and we are determined to fix our prices at a standard so low that dealers in our line of goods can lay in their Winter Stocks, and have a wider margin for profit than they have ever had before.

STANFORD BROTHERS,
121, 123 and 125 California street—Near Front.

REMOVAL.

BARRON & CO. HAVE REMOVED to the northeast corner of Montgomery and Jackson streets.

MAPS! MAPS! MAPS!

OF EVERY Description—War Maps of the latest date. We are constantly receiving Maps and Atlases, from J. H. Colton, by every steamer.
W. HOLT, 306 Montgomery St.,
Corner of Pine, Map Depot.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, NOVEMBER 30, 1861.

NO 11.

Evidences show that at one period volcanic eruptions have rent the fissures and metallic veins of this country. At no distant day when excavating and tunnelling in the new silver fields shall have fairly progressed, this fact will be still more manifest. We have already learnt that one of the lodes in Washoe said to be rich has been lost sight of. Earthquakes have also produced a similar dislocation of fissures or metallic lodes, though not so frequent on this coast, will yet baffle the miner to recover the vein thus lost. In Nevada County thousands of dollars have been spent in searching lost leads, but without success. It is for this reason that we insert the annexed illustration, emanating from the best geological authority—Sir Charles Lyell. Our mining community have not availed themselves of science in that respect, and as a general thing are prone to disregard hypothesis laid down from actual experience and observations.

As some intelligent miners, after an attentive study of metalliferous veins, have been unable to reconcile many of their characteristics with the hypothesis of fissures, I shall begin by stating the evidence in its favor. The most striking fact perhaps which can be adduced in its support is, the coincidence of a considerable proportion of mineral veins with faults, or those dislocations of rocks, which are indisputably due to mechanical force. There are even proofs in almost every mining district of a succession of faults, by which the opposite walls of rents, now the receptacles of metallic substances, have suffered displacement. Thus, for example, suppose *a a*, Fig. 1, to be a tin lode in Cornwall, the term lode being applied to veins containing metallic ores. This lode being applied to veins containing metallic ores. This lode running east and west is a yard wide, and is shifted by a copper lode (*b b*), of similar width.

The first fissure (*a a*) has been filled with various materials, partly of chemical origin, such as quartz, fluor-spar, peroxide of tin, sulphuret of copper, arsenical pyrites, bismuth, and sulphuret of nickel, and partly of mechanical origin, comprising clay and angular fragments or detritus of the intersected rocks. The plates of quartz and the ores are, in some places, parallel to the vertical sides or walls of the vein, being divided from each other by alternating layers of clay, or other matter. Occasionally the metallic ores are disseminated in detached masses among the vein stones.

It is clear that after gradual introduction of the tin and other substances, the second rent (*b b*) was produced by another fracture accompanied by the displacement of the rocks of *b b*. This new opening was then filled with minerals, some of them resembling those in *a a*, as fluor-spar (or fluato of lime) and quartz; others different, the copper being plentiful and the tin wanting or very scarce. We must next suppose the shock of a third earthquake to occur, breaking asunder all the rocks along the line *c c*, Fig. 2; the fissure in this instance, being only six inches wide, and simply filled with clay, derived, probably from the friction of the walls of the rent, or partly perhaps washed in from above. This movement has heaved the rock in such a manner as to interrupt the continuity of the copper vein (*b b*), and at the same time to shift or heave laterally in the same direction a portion of the tin vein which had not previously been broken.

Again, in Fig. 3 we see evidence of a fourth fissure (*d d*) also filled with clay, which has cut through the tin vein *a a*, and has lifted it lightly upwards towards the south. The various changes here represented are not ideal, but are exhibited

THE DISPLACEMENT OF LODES BY EARTHQUAKES OR VOLCANIC ERUPTIONS.

in a section obtained in working an old Cornish mine, long since abandoned, in the parish of Redruth, called Huel Peever, and described both by Mr. Williams and Mr. Carne. The principal movement here referred to, or that of *c c*, Fig. 3 extends through a space of no less than eighty four feet; but in this, as in the case of the other three, it will be seen that the outline of the country above, *d, c, b, a*, &c., or the geographical features of Cornwall, are not effected by any of the dislocations, a powerful denuding force having clearly been exerted subsequently to all the faults. It is commonly said in Cornwall that there are eight distinct systems of veins, which can in like manner be referred to as many successive movements or fractures; and the German miners of Hartz Mountains speak also of eight systems of veins, referable to as many periods.

METEORS.—M. Le Verrier has lately written a letter to Marshal Vaillant on the present solar system. He concludes that there are three rings of matter revolving round the Sun—one between the Sun and Mercury, the second near the Earth, including the meteoric stones and shooting stars, and the third between Mars and Jupiter, consisting of small planets. The ring of asteroids between the Sun and Mercury has a total mass about equal to that of Mercury. The ring which supplies our aerolites and shooting stars has a total mass of not more than a tenth part of that of the Earth. The total mass of small planets between Mars and Jupiter is greater than one-third that of the Earth.

STRUCK IT.—The Butte Democrat learns that the Spring Valley Mining Company have at last succeeded, after two years' labor, in finding the old lead of gold which they had lost. They expect to make a big strike.

Metallic Veins.

(From the Miners' Companion and Guide.)

These are seams, or tubular-shaped masses, that almost always traverse the direction of the strata, and are composed of materials that differ from those of the rocks which they intersect. They vary much in their magnitude, yet the length and depth always bear a certain proportion to each other, and the breadth to the length and depth. The length and depth are frequently nearly alike. Few metalliferous veins reach above 1800 feet in depth, or 1200 feet below the surface of the mountains in which they are situated. In general veins continue in one direction, and are usually much inclined, always more so than beds. The metallic matter called ore rarely occupies the whole of the vein, but is disseminated through the quartz, sulphate of baryta, wacke, granite, etc., which constitutes the greater part of the vein, and is called the gangue, matrix, or veinstone.

Metallic veins are most numerous in primary and secondary rocks. They occur more frequently in that hilly country than in steep mountainous country, and generally on the ridges of the hills. Beds, on the contrary, are more abundant in steep and mountainous country. As a general fact the veins are seldom rich near the surface; but increase in value at a medium depth, and grow poor again at a greater. They are most productive near the junction of stratified and unstratified rocks. Their productiveness also depends on their direction somewhat; an east and west direction being regarded in some mines as the most favorable, while the north and south veins are usually unproductive. Great metallic veins usually run parallel with the general direction of great valleys.

Bertola's Patent Amalgamators.

It is perhaps not generally known throughout this coast, that Bertola's Patent amalgamators are among the first, best, and most valuable inventions for the treatment of precious metals. We have heretofore described many new processes, many of which are nothing else than Bertola's plan, and some day litigations for infringements, will mar the proceedings of those interested in this nefarious traffic. The annexed illustrations are rough sketches of Mr. Bertola's Patent; in his application to the Commissioners of Patents, he says:

"My invention or discovery is for an improvement in treating ores of the precious metals preparatory to amalgamation, the object of said invention or discovery being to economize the operation by preventing loss in quicksilver, as well as to secure a large product of gold and silver. This discovery is more particularly designed for treating auriferous ores, and the tailings left from such as may have been operated upon in the old way) and the principle of my said discovery or invention lies chiefly in submitting such auriferous ores to a treatment of pyroligneous, acetic, or other similar vegetable acid, which treatment produces certain effects upon the sulphurets of gold, whereby the metallic gold is liberated and may thus be easily amalgamated with quicksilver. This treatment has also the effect to neutralize, or counteract, or

correct the alkaline nature of certain gangues which act to impede the amalgamating process and render it slow and defective. It is well known that by the old way of roasting such ores, or in their treatment with mineral acids and salts, there is a loss to a very serious extent—in the one case by volatilization, and in the other by destroying the quicksilver; and this effect is also produced by all ores of a pyritous nature when submitted without previous chemical treatment to be amalgamated. I have discovered that the employment of pyroligneous, acetic, or other like vegetable acids, in the treatment of the ores above described, has resulted in a large saving of the mercury, and also in the increased product of gold, so much so indeed, that I am enabled to operate very profitably upon tailings held to be too poor to pay for the working in either of the old modes. The ores are first to be reduced by grinding, in any of the usual methods, to as minute subdivisions as may be, the finer the better. I then put a charge of said ores into a boiler or cauldron of suitable size, according to the quantity to be operated upon. The vegetable acid is then introduced; if pyroligneous acid of the usual commercial strength, say to every bushel of the ground ore one gallon or thereabouts of acid. The temperature is then to be raised to the boiling point, and so continued from four to six hours, and until the whole of the acid is evaporated. The ores may now be operated upon with quicksilver in the usual way, or as I prefer by means of a new amalgamating mill, a description of which I have filed in the Patent Office as a separate application for letters patent. If acetic, oxalic, or other vegetable acid, is to be used instead of pyroligneous, (which latter from its cheapness and the readiness with which it may be manufactured at the mines, will be likely to be most involved) its strength may be regulated by the addition of water, or it may be poured into the boiler where the ores have already been mixed with water, and then subjected to heat and evaporation as before. Heat is not absolutely necessary its use being to hasten the process. The acid may be applied to the ground ore, and allowed to act upon it for several months under the ordinary temperature of the atmosphere, and then those may be submitted to the amalgamating process. I claim the use of pyroligneous, acetic, or other vegetable acids having similar chemical action, in treating gold or silver ores or tailings, preparatory to amalgamation, substantially as described herein." In a recent pamphlet published by the owners for Nevada Territory, we find the following description and *modus operandi* by Mr. John Stagg: "1st. Patent for amalgamator. 2d. Patent for treatment of ores of gold and silver. The peculiar construction of the amalgamator is such as to bring all the particles of matter, however finely divided or pulverized, into intimate contact with the quicksilver—a certain degree of pressure upon the bottom being one of the conditions necessary, and another in the mode in which the materials are agitated to insure the passing of all regularly under the bottom of the miller. For effecting this the miller is constructed to act as a partition, dividing the tub into two compartments from top to bottom, or nearly so, or at least to the height at which the ground ores are admitted.—The miller is made of wood and its bottom faced with iron, which is grooved like a mill stone. The operation is a slow and regular revolution of the miller, to be maintained by a suitable power. The pulverized ores containing the precious metals are introduced, and water added until the tub is nearly full; the mercury being then poured in, the operation goes on, the quantity of mercury being regulated somewhat by the richness of the ores. Ordinarily, from eight to ten pounds of mercury is sufficient for one mill. As the miller revolves it constantly passes over the mercury, spreading it out in a thin stratum upon the bottom, while at the same time that it sweeps over it also agitates the ores, the lightest particle of gold or silver in which will be brought into contact and immediately caught by the mercury. The motion of the miller is such as, while carrying around the whole mass of ores in the two compartments formed by said miller, to cause a change in that of one side to that in the other, in order to do which all must pass beneath in a very thin stratum. The action must be maintained for such a period of time as may be found necessary, generally about two or three hours being necessary to exhaust a charge. At the time of discharging the exhausted ores, the plug in the spout in the rear is to be removed, and the refuse allowed to flow out. This will be done slowly, the miller still continuing in operation until the whole has been discharged as nearly as may be. The amalgamated mercury will now be exposed, and may be examined. If it is still capable of taking up more gold or silver, the tub may be filled up with a fresh supply of ore; if otherwise, then stop the spindle, lift the driving arm off the pins, take out the wedge which supports the platform, when the tub may be tilted over and the mercury readily removed. The tub may then be tilted back and the work go on as before. The object of the process of treating the ores of the precious metals preparatory to amalgamation is to prevent loss of quicksilver, as well as to secure a large product of gold and silver, the principle of which is to submit the pulverized ore to a treatment of certain vegetable acid, which treatment produces

certain effects upon the sulphurets of gold and silver which renders the metals of the same easily amalgamated with quicksilver. This treatment has also the effect to neutralize or correct the alkaline nature of certain gangues which act to impede the amalgamating process and render it slow and defective. It is equally efficacious in the treatment of all ores containing mineral acids and salts, thereby preventing the destruction of the quicksilver which would ensue if the ores were submitted to amalgamation without chemical treatment.

Very respectfully your obedient servant,
JOHN STAGG,
President Aurora Gold and Silver Mining Co.
San Francisco, March 31st, 1860.

This process is now extensively employed both in this State and adjacent Territories. Mr. John Stagg is the proprietor for California, and Messrs. Middleton & Co. for Nevada and Utah Territory, with whom alone favorable arrangements can be effected, both reside in this city.

BERTOLA'S PATENT AMALGAMATORS.

Fig. 2.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....NOV. 30, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sanson streets, by

J. SILVERSMITH, Editor and Proprietor.

At Fifty CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STYLOGRAPHY and ELECTROGRAPHY. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York *World*, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr. Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

An Appropriate Memorial.

The chamber of commerce in this city have petitioned the Secretary of the Treasury of the United States, wherein they ask a modification of the ten per cent. duty levied on ores or minerals from foreign parts.

It may be necessary in these troublous times to collect an intrinsic duty on all articles imported or exported; otherwise we consider this tax unreasonable and unjust, when we take into consideration that other governments do not enforce or levy such duty. We are just beginning to receive some importations of this nature from Mexico, and a favorable business connection seems to exist, and that this will eventually prove highly lucrative and beneficial to this State there can be no doubt. There is now and hereafter will be considerable capital invested in the erection of smelting and reducing establishments, for all kinds of ore or minerals containing precious metals, which employ many operatives, but for this duty, might prevent capitalists from entering upon such investments, is also apparent. The memorial is therefore well indited and directed, and we sincerely hope that this petition will receive the attention it merits. We clip therefrom the most material point:

"As the Revenue Acts impose no duty on these ores in direct terms, (leaving the classification to come under non-enumerated articles, therefore subject to a duty of ten per cent.) we can scarcely believe that it was the intention of Congress to levy a duty upon them, particularly as bullion

in bars is admitted free. We address you as the head of the Financial Department of the Government with the view of soliciting the influence of the Department in securing its modification.

The policy of admitting gold and silver ores free of duty is very generally conceded at this day by commercial nations, and the Chamber can conceive of no reason why the United States should form an exception.

In the opinion of the Chamber the revenue to the Government from this source will never be of great moment, whilst the imposition of the duty may be seriously detrimental to the business of this port.

The mercantile community are making strenuous efforts to establish a regular trade between San Francisco and ports on the Western coast of Mexico, as our position and advantages indicate that such a trade must be both extensive and profitable. Heretofore the silver mines of Mexico have done much for this trade, as the transportation hither of the ores has furnished freight for the vessels engaged in it, and the ore itself has afforded a safe and convenient medium of exchange. Most of the silver extracted has also been invested here, and its value returned to Mexico in American manufactures.

But aside from these considerations, it seems but justice to our citizens and those of Mexico who have been engaged in these importations, and invested their capital in good faith, that no unusual burden should be placed upon them.

Fine Claims in Nevada Territory.

The Mammoth Quartz Ledge is situated in the Eagle mining district, about forty miles nearly in a direct south course from Virginia, supposed by many to be a continuation of the Comstock ledge. The ledge is a very extensive one, being from eighty to one hundred feet in width. The ore is mostly silver—a small amount of gold in it, about the same proportion as in the Ophir mines. The ledge has been struck only about thirty feet from the surface, and the ore will compare favorably with the best in the Territory. It is nearly pure antimony and silver. A number of assays has been made, and it yields from two hundred to six hundred dollars in silver. A number of tunnels have been commenced that will strike the ledge from three hundred to four hundred feet from the surface—some of which are expected to be in by the first of April next; when, in it is believed that these claims will be second to none in the Territory. The facilities for working are excellent; plenty of wood at three dollars per cord, and a water-fall, machinery, provisions &c., can be had as cheap as at Carson city.

Walking on the Water.

The *Morning Call* says that Henry Robert Rowlands, of San Francisco, has designed and patented an apparatus which will, it is claimed, enable a person to walk easily and safely over the surface of the roughest water, similar inventions have been made and tried before, but never succeeded. The *Call* describes as follows the apparatus of Mr. Rowlands and also an experiment made by him on the smooth waters of the Bay of San Francisco, near Steamboat Point, on the 22d inst.:

It is simple enough. A couple of 'shoes,' as Mr. R. calls them, shaped somewhat like an Indian's bark canoe, made of a white cedar frame-work, covered with cloth asphaltized lightly—but sufficiently to prevent the absorption of the water—seven feet long and three and a half inches in depth. The "shoe," in which the right foot is placed, has a couple of parallel brass rods running along the whole length of its upper surface on the left. To these the left "shoe" is secured by two clamps so arranged as to slide along the rods with perfect freedom, obeying easily the propelling power of the experimenter's legs.—The right and left "shoe" are thus placed and joined side by side. Outside of each is a thin slat, commencing in the centre, and running in a direct line aft of the walker. These help to prevent lee-way.—To still further prevent it, underneath each "shoe," of the same width, (about two feet), and at intervals along their entire length, are placed thin pieces of light wood, working on hinges, which are arranged to lie close to the bottom of the "shoe," while in forward motion; but when the propelling power ceases, they drop perpendicularly, and, in a degree, hold one "shoe" in place while the other is being pushed ahead. The experimenter's feet are inserted in the centre of each of these mammoth "shoes," resting on the lower part of the frame work, the leg being protected by a leather surrounding, rising halfway to the knee. A couple of stanchions on either side of the legs afford the means of adjusting a seat, where, when fatigued, the walker can rest. To these stanchions a square sail can be also rigged, and a respectable degree of speed attained without any exertion on the part of the aquatic adventurer. A small oar, fixed in the "heel" of the right "shoe," is the steering apparatus.

Mr. Rowlands took his "shoes" out of the case, and put them on—or, rather, put himself in them—in about ten minutes, and then stepped boldly out on the placid waters, in the presence of quite a knot of spectators, who were puzzling their brains, after a careful look at the apparatus,

as to "How he was going to make it work," an idle ship carpenter betting a Steamboat Point *habitué* who was sunning himself on a rock, that "he'd be drowned as soon as he got out of his depth." He went out of his depth, however—a half mile out of it, at a "killing pace," but with apparent ease. It was an awful stride, and, we think, is admirable for the development of the leg muscles. When Mr. R. got out far enough to satisfy everybody looking on of the capacity of his shoes, he pulled his feet out of them, plunged overboard, and swam a short distance, and then, to prove their great buoyance, placed himself in them again, to the intense admiration of the spectators, and the discomfiture of the ship-carpenter, whose bet contemplated his speedy decease. Before reaching the shore, he rigged his sail to the stanchions, and showed how, when fatigued, the walker could be assured of headway, providing the wind was fair, while he was resting his tired limbs. Mr. Rowlands, we believe, don't claim that he can make much progress against wind and tide. Everybody being satisfied, the ingenious Rowlands walked to the shore, took off his shoes, and was congratulated on his success.

Mr. R. is a modest man, as is generally the case with men of great merit. He don't claim perfection for his water shoes; but they are valuable for many uses besides simply gratifying curiosity. In case of ship-wreck, when a vessel is stranded, he claims to be able to establish communication between the ship and the shore, even through roaring breakers and boiling surf, where a boat could not live for an instant; and says it is impossible from the construction of his shoes that he can be upset. He intends to exhibit his invention at the World's Fair.

List of the Fossil Shells, found in the Tertiaries of Contra Costa County.

(All the following remarkable remains of an ancient world may be seen in Mr. Piche's collection of fossil tertiary shells, from the geological formations of California.)

BIVALVES.

- | | |
|--------------------------|------------------------------|
| 1. Mytilus, two species. | 8. Venus, several species. |
| 2. Modiola. | 9. Cardium, two species. |
| 3. Ostrea, two species. | 10. Latraria. |
| 4. Solen. | 11. Tellina. |
| 5. Cytherea. | 12. Pecten, several species. |
| 6. Leda. | 13. Area. |
| 7. Mactra. | 14. Unio (?) |
| | 15. Inoceramus (?) |

Other genera are also found.

UNIVALVES.

- | | |
|----------------------------------|-------------------------------|
| 15. Turritella, 2 or 3 species. | 24. Ammonites, sev'l species. |
| 16. Dentalium. | 25. Nautilus. |
| 17. Pyrala. | 26. Natica, several species. |
| 18. Crepidula. | 27. Helix (?). |
| 19. Calyptraea, several species. | 28. Conus. |
| 20. Buccinum. | 29. Cypraea (?). |
| 21. Vernetus. | 30. Trochus. |
| 22. Murex. | 31. Purpura. |
| 23. Turbo (?) | 32. Nassa. |

And several other genera of univalves.

To this may be added many other fossils, such as teredina, in fossil wood, balanus, sentella, asterias (sea-star), remains of balena and lamna; fossil wood of every sort, and a large variety of impressions of leaves.

Important Discoveries in Santa Clara.

The San Jose *Mercury*, of a late date, has the following: The discovery of coal-oil, silver and copper, in the coast range, is creating quite an excitement among some of our Santa Clara people. An oil spring, near Moody's Mill, on the Santa Cruz road, is really worthy of attention. No one had any knowledge of it till recently. Here is the history of its discovery. Some men were felling timber for saw-logs. They noticed, on felling a tree across a piece of ground, that the water, as they supposed, shot up from the ground, as the result of the concussion. Directly after this a very unpleasant smell was perceptible. This led to an examination, when a small hole was dug, which filled with something that resembled oil. Taking some home they found it would ignite. Some of it was taken to a chemist, and he pronounced it an excellent article of oil, in a crude state. But a small percentage of it was other than oil. We believe the spring is now in the possession of H. D. McCobb, formerly Postmaster of Santa Clara. This led to further search, and some other springs have been discovered. The original spring will yield, it is estimated, from four to five barrels per day. Some think they are fabulously rich. S. G. Melon has also come in from the mountains beyond Lexington, and brings, as he says, very rich specimens of copper ore—richer than that of the far-famed Copperopolis mines. He has staked off several claims. He has also found traces of silver and gold, and thinks they will lead to important discoveries. If this is so, mineral wealth is at our very door.

CALF SKIN KNAPSACKS.—There is a knapsack made after the French and German style; it is of calf-skin, tanned with the hair on. These knapsacks possess many advantages over those made of other materials—are much more durable—shed the rain quickly—do not draw the sun's rays, and in fact, are a decided improvement over those commonly used. Attached to them is a tin, containing a pan to fry in, a dip per, &c.

WM. M. LENT, President.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munn & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts., 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rehearing, and for appealing to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

United States Branch Mint Statistics and Notices.

We give this week some interesting facts connected with the above office. Elsewhere we have made certain statements, which are mainly based upon the following statistics for the past two months.

The following new notice, establishing an extra charge on bullion deposited, has been posted up; those depositing will act accordingly:

U. S. BRANCH MINT. Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

Deposit for October, 1861.

Gold, gross.....oz.	66,217.40
Value.....	\$1,244,832.09
Fine gold.....oz.	21,392.73

Coinage for October.

Gold.....	\$1,130,000
Silver.....	109,000

Total Coinage.....1,239,000

Increase in Gold deposited, over Sept.....oz. 10,018.03

Decrease in silver.....oz. 7,558.25

Coinage for September.

Gold.....	\$1,220,000
Silver.....	68,000

Total coinage.....\$1,288,000

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hemstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hemstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hemstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hemstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a equal showing for our mint, and speaks well for Mr. Hemstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths fine.....3cts per oz.
" from 300-1000ths. to 750-1000ths fine.....7cts " "
" " 750-1000ths to 950-1000ths ".....14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$

per ct. on gross value of gold for coining. Refining charges in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.2 per standard oz., and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver registers as most congruous with the physical aspects of the material but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

METALLURGICAL WORK

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business practically and theoretically, offers his services to a responsible party with the necessary CAPITAL for the construction and superintendence of works of this nature. Further particulars at the office of the Press. ap19

QUARTZ MINERS, ATTENTION

DR. BEERS would call particular to his improved
AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:
1st. They are equally adapted to the amalgamation of Ores either wet or dry.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.
3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will extract from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other: three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes. The Pans are four feet in diameter, and supplied with a perforated, grate bottom, upon which the grinding is done, and which allows the gold as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, First Street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars inquire of the Patentee,

J. B. BEERS

Me15

165 Clay street,

LEWIS COFFEY & RISDON'S

STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Locomotive Making Establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted as quality.

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of a who admire and practice the GAME OF BILLIARDS. DAN LYNCH,
720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and saleroom for

Phelan's Patent Combination Cushions and Modern Billiard Tables,

And Billiard Trimmings of every description. Parties desiring to purchase Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority of the Cushions and Tables. Mr. DAN LYNCH will always be on hand, ready to give all required information with regard to the merits of the JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES,
Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables.

HALLIDIE.

PATENT

WIRE ROPE MANUFACTURERS

—AND—

Wire Suspension Bridge Builders.

OFFICE:

WORKS:

12 Clay Street, North Beach.

WIRE ROPE IS FORTY PER CENT. LIGHTER, LESS THAN ONE HALF THE DIAMETER, AND SIX TIMES AS DURABLE AS MANILLA OR HEMP ROPE OF EQUAL STRENGTH, AND IS UNAF-

FECTED BY CHANGE OF WEATHER.

It is more particularly adapted for

FERRICK GUY ROPES, FERRY ROPES

And for hoisting from Deep Shafts and Inclined Planes.

Engineering Companies or Ferry Owners, who use rope for winding, hoisting, or pulling purposes, will effect an immense saving by ordering WIRE ROPE through our Agents.

Circulars, with scale of weights, sizes, strengths, and list of prices attached, will be forwarded to those interested, who can then compare the cost of Wire and Hemp Rope, by addressing the manufacturers.

SUSPENSION BRIDWORK!

For SUSPENSION BRIDGES, Aqueducts, Etc., erected on moderate terms PERMANENCY GUARANTEED.

PALTENGI & LARSENEUR.

Between Street [Old Nos. 130, 132; New Nos. 422, 424].

**MARKET STREET RAILROAD**

DURING THE WEEK CARS RUN FROM SAN FRANCISCO TO MISSION AND WILLOWS:

FROM MISSION From 6 1/2 A. M. to 11 1/2 P. M.
Connecting with the Hayes Valley Car and Lone Mountain
tunnels, from this date.

SUNDAYS AND FEAST DAYS—

A new set of large and convenient cars will be added for the accommodation of the public.

F. L. A. POCHE, Trustee.

A SPLENDID OPPORTUNITY.**AGRICULTURAL MACHINERY.**

I have taken, for five years, a large portion of the State Prison Labor, for the sole purpose of manufacturing

AGRICULTURAL IMPLEMENTS AND CABINET WARE

offer for sale, at a Great Sacrifice, in order to close out my present stock September First, 1861, the following articles:

TWELVE-HORSE STEAM THRESHERS;
C. M. RUSSELL'S EIGHT AND TEN-HORSE THRESHING MACHINES;
J. A. PITTS' GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND
TWELVE-HORSE POWER, with all of C. M. Russell's latest im-

provements.
HAY PRESSES, REAPERS AND MOWERS;
EXTRA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE
RAKES.

All of the above goods will be sold at the Lowest Prices, either for Cash, or
on approved paper at a low rate of interest.

THOS. OGG SHAW,

33 Sacramento Street.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission
and Howard, San Francisco, California.—By recent additions to
their extensive establishment, we can confidently announce to the public
that we now have

*The Best Foundry and Machine Shop on the Pacific
Coast.*

With upwards of forty five thousand dollars worth of patterns, we are en-
abled to do work cheaper and quicker than any other establishment on this
side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines,
both Marine and Stationary; Straight Quartz Mills of all sizes and
designs; Stamp Shoes and Dies of iron, which is imported by us expressly
for this purpose—also peculiar hardness making shoes and dies last two or
three months. Mining Engines of all sizes and kinds; Floating Mills; Gang,
Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per
day, and more perfectly than any now in use. One of these shingle machines
can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hans-
com's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now
in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron.
Car Wheels and Axles of all dimensions; Building Fronts; Horse Drawers;
Saw Mills; Baker Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Pa-
tent; and to make a long story short, we make castings and machinery of
every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully
solicit a continuance of their patronage. Before purchasing, give us a call
and see what we can do.

GO DDALD & CO

**ADVANTAGES**

—OR—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight

of Stamps, Twenty-Five per cent. more rock

than any other mill yet invented. It is also

Cheaper, more Durable and run with Less

Power. All parts of it being fitted together

before leaving the shop, it can be put up

set at work Crushing the Ore, in Ten Hour

ter arriving on the ground!

Every one exclaims after seeing the Mill in
operation, "Why has not so perfect and yet
simple a mill been invented before? It would
have Saved the Fortuno of many a Minor
expended in worthless machinery, and enriched
the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mining Company, }
Ophir Mining Company, } San Francisco
Union Reduction Company, }
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated
Vermont Reaper and Mower, which is unsurpassed for Simplicity, Dur-
ability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who
have used it, justifies the expectation that, with the late improvements, it
will become the leading machine, when its superior qualities are generally
known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE
HAS OVER OTHERS, ARE AS FOLLOWS:

1st. Having the cutter bar hinged to the frame, so as to adjust itself to un-
even surfaces.

2d. Having two driving wheels, if one slips the other does the work.

3d. When the machine moves to the right or left, the knives are kept in
constant motion by one or the other of the wheels.

4th. It can be alied, throws in or out of gear, without the driver ayling
his seat.

5th. The whole weight of the machine is on the wheels, where it is needed
to give power and stroke to the knives.

6th. When the machine is backed, the knives cease to play, consequently
you back away from obstructions, without danger of breaking the knives.

7th. The cutter-bar being hinged to the machine, can be picked up with
out removing bolt or screw.

8th. The cutter-bar is readily raised by a lever, which is very convenient
at the corners of the field; when raised, the machine will turn as short and
easily as any two-wheeled cart.

9th. It is made of iron, simple in construction, and a boy can manage it
easily.

10th. It has no side draft.

11th. The combined machine has two sets of cutter bars and sickles, one
for mowing, the other designed expressly for reaping, which, with other
improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchas-
ing.

KNAPP, BURRILL & CO.,

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS!

The undersigned, having had great Experience and Fa-
cilities for completing and carrying out inventions and improvements
upon all kinds of Machinery and Implements, also preparing the requisite
Drawings, Models, Drafts and Specifications, and is otherwise conversant
with all principles in Mechanics of modern practice and could prove, there-
fore, of invaluable aid to Inventors and Discoverers. Those contemplating
bringing their inventions in a proper shape before the U. S. Patent Com-
mission are particularly requested to consult the subscriber.

5. *A Note on the power of Polarization of American Oil of Turpentine*; by Dr. F. MALLA. (In a letter to the Editor)—It has been already mentioned by Guibourt and Bouchard that the American oil of turpentine possesses a power of rotation $18^{\circ}6'$ to the right.

Numerous experiments with commercial spirits of turpentine enable me to state, that its powers of rotation is far from being constant. I have examined specimens, which had a power of rotation of 14° degrees (28 degrees in my instrument with a tube of 200 millimetres) while others had turned it 20° deg. to the right. Most of the specimens possessed a power of rotation of $19^{\circ}5'$.

Oil of turpentine of $19^{\circ}5'$ subjected to distillation together with water, yielded two oils of different rotating power. The first distillate rotated $22^{\circ}5'$,—the last portion $16^{\circ}38'$.

The rotating power of neither of these two portions was changed by redistillation.

The boiling point of the first was a few degrees lower than that of the second portion. It commenced boiling at 295° F., while the thermometer was constantly rising, until it reached 209° deg. F. The final boiling point of the latter did not exceed 315° deg. F.

These data seem to indicate that the American oil of turpentine consists of two or more different hydro-carbons, which are probably polymeric to each other.

Chicago, Jan. 12th, 1861.

ARREST.—Two miners residing near Rattlesnake Bar, on the North Fork of the American river, by the name of Joe Kimball and Mr. Ayers, who having been successful in mining had accumulated quite a little sum of money. Mr. Kimball took the precaution to bury seven hundred and fifty dollars of his, in twenty dollar pieces, and marked some of the coin; during the month of September last, he went to dig it up, and behold! it was gone. Suspicion was directed toward some Chiuamen at first, but nothing definite could be found out. A few days after Mr. K. came to Auburn and advised Constable Boggs about the matter, and after consulting they came to the conclusion that his partner, Mr. Ayers had something to do with the stealing. They resolved to keep the matter quiet as Mr. A. had some intention of going East. The affair remained in *stetui quo* until a few days ago when they both concluded to visit their old homes. The day before they started Mr. K. came to Auburn and swore out a warrant. Upon the following day Constable Boggs went to Folsom and upon the arrival of the parties arrested Mr. Ayres and found over three thousand dollars upon his person. On Wednesday he was taken to Ophir and tried: the maked coin was identified and sworn to. The Justice of the Peace held the accused to answer for "grand larceny" at the next term of the Court of Sessions.

MINES OF NEVADA.—A committee appointed to consider certain suggestions of Gov. Nye concerning the mining interest of Nevada Territory, has reported in favor of adopting that feature in the California statutes which permits miners to frame their own regulations, and gives them equal legal force with Legislative enactments. But the Committee do not endorse the Governor's proposition to tax the value of mines, against which they urge the same arguments that are familiar to Californians on the same subject. Inasmuch, however, as there can be no revenues raised in the Territory without taxing in some shape its mines, which are almost its only property, the Committee recommend a tax on the net profits arising from the workings of the same. They also recommend that the Nevada delegate to Congress be instructed to use his influence to secure the passage of a law relative to the mineral lands of the Territory, securing to its citizens the same rights and privileges as are granted to the citizens of California.

THE WASHOE SALT MINES.—The *Territorial Enterprise* of Nov. 13th, published at Virginia City, observes: The parties who own the salt mines which were discovered last summer, seem to have without being aware of it, discovered a fortune. Quite a number of loads of salt have been taken from them, and on the return of the trains, the supply of salt is renewed in the place from whence it was taken, as there is a continued uprising of the salt water, and a constant evaporation, which keeps up the supply. The salt is now being delivered here to several of our mills, and quite a quantity of it is being stored at the Indian Reservation, about thirty miles this side of the mines, to supply the winter demand as they will not be able to reach the mines during this season of the year, owing to the bad state of the roads.

CHINA THIEF.—A gentleman living on Secret Ravine by the name of Robert Wiley, had his cabin broken into on Thursday afternoon, and two pair of boots, a pistol, blankets and other things stolen. As soon as the robbery was found out, Mr. Wiley started to Auburn and informed the watchman, Wm. Osborn, and Constable Boggs of the affair, and through the assistance of a Chinese broker they succeeded in ferreting the fellow out, obtained some of the stolen goods and lodged the aforesaid in the County Jail. Stealing in this vicinity has become quite an epidemic.

COPPER ORE.—The schooner *Alpha* has arrived at Victoria from Queen Charlotte's Island, and brings with her 25 tons of what is said to be "peacock copper ore".

HOW TO TAN SKINS.—Nail the fresh skin tightly and smoothly against a door, keeping the skinny side out. Next proceed with a broad bladed, blunt knife to scrape away all loose pieces of flesh and fat; then rub in plenty of chalk, and be unsparing of labor. When the chalk begins to powder and fall off, take the skin down, fill it with finely ground alum, wrap it closely together, and keep it a dry place for two or three days.—At the end of that time unfold it, shake out the alum, and the work is done.

FOSSIL REMAINS NEAR DAYTON.—We are informed by Mr. W. H. Murray, that about two miles southeast of Dayton there is a formation of sandstone, on the southern edge of the coal fields, with thirteen prints or footmarks of an animal, whose species is now supposed to be extinct. The footprints measure fourteen inches in length. Those who pretend to know, say it resembles the track of a large moose. The geological formations indicate that the prints were made more than a thousand years ago. Mr. Sterling, of that place, is having the marks excavated from their bed to be sent to the World's Fair in London.

The Mountain Messenger of Laporte, Sierra Co., remarks that the New Era Company, at Howland Flat, have the most economical method of hoisting drift dirt that we have ever learned of. Two cars, each attached to a large water box, or tank, are hung by a strong chain slung over a revolving wheel. The box of the empty car at the top of the shaft is filled by a stream of water from the reservoir, which immediately lowers the same and raises the loaded car and empty box from the bottom. A drain tunnel furnishes the way for discharging the water after accomplishing its mission. It works briskly and with entire satisfaction. The shaft is 121 feet in depth.

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors. In order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH,
GOVERNMENT HOUSE,
SAN FRANCISCO.

N. B.—R. W. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will

hereafter transact all business pertaining to patents for us, at the patent office in Washington city. For instructions on the new law regulating patents, we refer the inventor to the above.

Miners, Inventors, Agriculturalists, Capitalists and Mechanics, will find it to their advantage to subscribe to the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

UNION IRON WORKS (ESTABLISHED IN 1849)

N. E. Cor. First and Mission streets, San Francisco.

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the twelve years, during which time new and extensive Buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS, MACHINERY AND CASTINGS,

Of every description, on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Powers, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work, Steamboat Repairing and Blacksmithing, etc.

STEAM ENGINES BUILT AND REPAIRED.

Besides the extensive assortment of Machinery Patterns, attention is called to the new and beautiful designs for Building Castings, Iron Fronts, Columns for Stores, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, Etc.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & G. M. WOODWARD'S PATENT.—This Pump is used for supply Steam Boilers, Mills and Public Buildings, with water. It can be arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the Discharge Outlet. It is suitable both for Marine and Mining purposes, being used on nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED.
PETER DONAHUE, Proprietor

OILS AND LAMPS BY LATE ARRIVALS.

STANFORD BROTHERS HAVE RECEIVED

A GREAT VARIETY OF COAL OIL LAMPS of every style of BURNING known to the trade. BRACKET LAMPS AND SIDE LAMPS with the largest burners in use. PARLOR AND STAND LAMPS—An endless variety of Patterns. CHAMBER LAMPS AND HANDLE LAMPS—Very cheap; may be carried about.

CHANDLERS AND LANTERNS. CAMPING LAMPS OF ALL KINDS. COAL OIL AND CAMPING WORKS. CHIMNEYS, SHADES, GLOBES—of every size, style and finish.

200 BARRELS SPERM OIL—At a lower price than ever before sold in this city.
100 BARRELS LARD OIL—Of our own importation.
600 TUBS KATE SEED OIL—In original packages.
100 BARRELS BOILED LINED OIL—guaranteed pure and free from fish oil.
300 CASES DOWNY'S KEROSENE.
300 CASES COAL OIL—At the very lowest market prices.
1,000 CASES CHINA OIL—In 2½ gal. tins.

We feel confident in assuring our CUSTOMERS and the TRADE generally that they will find our assortment of LAMPS and LAMP GLASS, as well as OILS and all kinds of BURNING MATERIALS, the most complete that has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms, and we are determined to fix our prices at a standard so low that dealers in a line of goods can lay in their Winter Stocks, and have a wider margin of profit than they have ever had before.

STANFORD BROTHERS,

121, 123 and 125 California street,—Near Front.

REMOVAL.

BARRON & CO. HAVE REMOVED to the northeast corner of Montgomery and Jackson streets.

MAPS! MAPS! MAPS!

OF EVERY Description—War Maps of the latest date. We are constantly receiving Maps and Atlases, from J. B. Colton, by every steamer. W. HOLZ, 305 Montgomery St., Corner of Pine, Map Depot.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred are informed that I have the most complete registry in existence of grav in that cemetery, having added to my own records by purchase, the book of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

VOL. IV.

SAN FRANCISCO, SATURDAY, DECEMBER 7, 1861.

NO 12.

THE VERMONT SEED-SOWER AND REVOLVING-HARROW.

Messrs. Knapp, Burrell & Co., have shown us the above highly interesting and most valuable agricultural machine. One of them was on exhibition at the State Fair, held at Sacramento recently, where it was also tested and acknowledged to be what we represent. The illustration is but a rough sketch (not executed at our office). A full sized working machine can only be seen at the agents' warehouse, 310 Washington street, and there also full description and particulars can be obtained. We advise farmers and others to examine this interesting piece of mechanism. Its cost is trifling, and the amount of labor saved immense.

With this machine, any person that can manage a pair of horses, can perform the operation of seeding and harrowing at the same time.

It is adapted to the sowing of all kinds of grain, and is regulated by the gauge to distribute evenly over the surface any desired number of pounds of grain per acre, covering the seed immediately, so that none of it is left in sight for the birds to destroy.

It is simple in construction, strong and durable, just the implement the farmer needs at the present time, to enable him to raise grain profitably at the present low prices.

It now makes its first appearance on the Pacific Coast.

The Coal Mines of the United States.

There are in North America five principal coal areas; compared with which the richest deposits of other countries are comparatively insignificant. These are the great central coal-fields of the Alleghenies; the coal-fields of Illinois, and the basin of the Ohio; that of the basin in the Missouri; and those of Nova Scotia, New Brunswick, Cape Breton, and the Monte Diablo district of California, an area of 50 miles square. Besides, there are many smaller coal areas which, in other countries, might well take rank as a vast national importance, and which even in North America will one day contribute greatly to the riches of various States.

The Allegheny or Appalachian coal-field measures 750 miles in length, with a mean breadth of 85 miles, and traverses eight of the principle States of the American Union. Its whole area is estimated at not less than 65,000 square miles, or upwards of 40,000 square acres.

The coal is bituminous and used for gas. In Kentucky

both bituminous and cannel coal are worked in seams three or four feet deep, the cannel being sometimes associated with the bituminous coal as a portion of the seam; and there are in addition valuable bands of iron ore. In Western Virginia there are several coal fields of variable thickness, one, $9\frac{1}{2}$ feet; two others of 5, and others 3 or 4 feet. On the whole there seems to be at least 40 feet of coal distributed in thirteen seams. In the Ohio district the whole coal field affords on an average at least 6 feet of coal. The Maryland district is less extensive, but is remarkable as containing the best and most useful coal, which is worked now to some extent at Frostburg. There appears to be about 30 feet of good coal in four seams, besides many others of less importance. The quality is intermediate between bituminous and anthracite, and considered well adapted for iron making. Lastly, in Pennsylvania, there are generally from two to five workable beds, yielding on an average 10 feet of workable coal, and amongst them is one bed traceable for no less than 450 miles, consisting of bituminous coal, its thickness being from twelve to fourteen feet on the south-eastern border, but gradually diminishing to five or six feet. Besides the bituminous coal there are in Pennsylvania the largest anthracite deposits in the States, occupying as much as 250,000 acres and divided into three principal districts.

Illinois coal field, in the plane of the Mississippi, is only second in importance to the vast area already described. There are four principal divisions traceable, of which the first, or Indian, contains several seams of bituminous coal distributed over an area of nearly 8,000 square miles. It is of excellent quality for many purposes; one kind burning with much light and very freely, approaching cannel coal in some of its properties; other kinds consist of caking or splint coal. In addition to the Indian coal field there appears to be as much as 48,000 square miles of coal area in other divisions of the Illinois district, although these are less known and not at present much worked. 30,000 are in the state of Illinois, which supplies coal of excellent quality, and with great facility. The coal is generally bituminous.

The third coal area of the United States is that of the Missouri, which is little known at present, although certainly of great importance.

British America contains coal in the provinces of New Brunswick and Nova Scotia. The former presents three coal-fields, occupying in all no less than 5,000 square miles; but the latter is far larger and exhibits several very distinct localities where the coal abounds. The New Brunswick coal measures include not only shales and sandstones, as is usual with such deposits, but bands of lignite impregnated with

various copper ore, and coated by green carbonate of copper. The coal is generally in thin seams lying horizontally. It is chiefly or entirely bituminous.

In Nova Scotia there are three coal regions, of which the Northern present a total thickness of no less than 14,570 ft. of measures, having 70 seams, whose aggregate magnitude is 44 feet, the thickest beds being less than four feet. The Pictou or central district, has a thickness of 7,590 feet of strata, but the coal is far more abundant, one seam measuring nearly thirty feet; and part of the coal being of excellent quality and adapted for steam purposes. The southern area is of less importance. Besides the Nova Scotia coal-fields there are three others at Cape Breton, yielding different kinds of coal, of which one, the Sydney coal, is admirably adapted for domestic purposes. There are here fourteen seams above three feet thick, one being eleven, and one being nine.

Mineral Wealth of the Pacific Coast.

There is no country in the world that can compare with California, and, in fact, the whole Pacific Coast, in point of mineral wealth. At first, every one was hunting for gold, not dreaming of the rich mines of wealth that lay concealed in the bowels of the earth in the shape of other minerals. After a time considerable attention was turned towards the quicksilver mines; then tin, iron, silver, copper, and at last coal mines have been discovered, and found to exist in different sections of the State, and in quantities that will yet prove a source of wealth. Of these probably the Monte Diablo coal mines are the most extensive; but in all sections of the State coal has been found to exist, and proper prospects will probably show it to exist in large quantities. The Amador Dispatch says that Messrs. Hall & Hannon, of the Iron City Flour Mills, have opened a vein in that country, from which they procure coal for their own use, of an excellent quality for manufacturing purposes, and the mine is said to be extensive. Thus every day is there some new discoveries of mineral wealth made, and we may safely say that no country in the world equals this in the variety and richness of its mineral deposits. Aside from the superiority of the soil for agricultural purposes, which cannot be excelled by any country on the face of the earth, its mineral wealth is sufficient to make a nation rich—all that the Pacific Coast needs, is population to work its numerous mines, and till its rich soil.—*Ex.*

Discovery of Oil Springs.

Mr. McCobb, of Santa Clara, exhibited to us a few days since, an article of petroleum, taken from springs recently discovered at Moody's gulch, on the mountain road, twenty miles from Santa Cruz, three miles from Lexington, Santa Clara Co. The discovery was made by some men engaged in cutting timber. A large tree had fallen, when it was observed that an oily substance was exuded from the earth, caused by the concussion. The oil, on becoming exposed to the atmosphere, emitted a strong smell, which led to an investigation of the causes which produced it, and the result was the discovery of extensive springs of this peculiar and valuable substance. The article shown us was a brown liquid bitumen, in a crude state, burning freely, and emitting a black and sooty smoke. The discovery is a valuable one, and may lead to others of like character in the Santa Cruz mountains. Petroleum may be rendered colorless by distillation, and it makes an excellent article of gas for illuminating purposes. It may be used in lamps and is also much used in the manufacture of India Rubber goods. Several European cities are illuminated with gas manufactured from petroleum and naphtha, a kindred substance. Mr. McCobb, at Gleason's Hotel, on the Santa Clara road, will be pleased to exhibit the article to the curious, and furnish interested parties with information concerning the location and value of the new discovery.—*Ex.*

Silver Process.

The amalgamation of silver ores is perhaps more systematically and economically conducted at Halsbruecke, in the vicinity of Freiberg, than in any other European locality. The usual constituents of the ores there treated are sulphur, antimony, arsenic, silver, copper, lead, iron, and zinc, which are more or less mixed with various earthy minerals, besides sometimes containing small quantities of bismuth, gold, nickel, and cobalt. In the selection of these ores, they are so assorted as not to contain above 7 per cent. of lead, or 1 per cent. of copper, as from combining with the mercury added, these metals give the amalgam a pasty consistency, and thereby render the treatment extremely difficult and expensive. The mixture of the different ores obtained from the mines is so arranged that the charges of the furnaces shall contain seventy-five to eighty ounces of silver to the ton of mineral; it is also essential that they should contain a certain proportion of sulphur. This usually exists in the form of iron pyrites, which, on being roasted, gives rise to the formation of the sulphate and oxide of iron necessary to the success of the subsequent operations. If, as is sometimes the case, the amount of pyrites naturally occurring in the ores is not sufficient for these purposes, addition is made either of this mineral, or in some instances of ready-formed sulphate of iron.

The ore, when thus prepared, is laid on a large floor, forty feet in length and about twelve in width, and on the top of it is thrown about 10 per cent. of common salt, which is let drop from an upper room, through a spout placed in the floor for that purpose. The heap, when it has been thus made up of alternate strata of ore and common salt, is well mixed by being carefully turned over, and is subsequently divided into small parcels called *roast posts*, each weighing from $3\frac{1}{2}$ to $4\frac{1}{2}$ cwt. The salt is usually employed for this purpose at the Halsbruecke works amounts to three hundred tons, and is supplied by the Prussian salt mines.

The mixture of ore and salt is now roasted in reverberatory furnaces provided with flue flues for the reception of any pulverulent matters which may be mechanically taken over by the draught. The prepared charge is spread on the bottom of the hearth, where it is at first very gently heated, for the purpose of expelling the moisture, which to a greater or less extent it invariably contains. During the process of drying, which usually occupies two hours, the charge is kept constantly stirred by a long iron rake, and when this operation is considered sufficiently advanced, the heat is so far increased as to cause the ignition of the sulphur, and to render the ore red-hot.

The furnace is kept at this temperature for about four hours, during which time the metals become oxidized, and sulphurous acid gas is rapidly given off, whilst the ore is by constant stirring prevented from becoming agglutinated in masses. The temperature is now still further raised, and sulphurous acid is again given off, together with vapors of chloride of iron and hydrochloric acid. The hydrochloric acid generated at this stage of the operation is due to decomposition of the chloride of iron, by the action of oxygen and watery vapor. This last firing, which occupies about three quarters of an hour, is continued with constant stirring until a sample taken from the furnace ceases to evolve any odor of sulphurous acid, and has for its object the decomposition of the sea-salt by the metallic sulphates produced. During this process the ore increases considerably in volume, and assumes a deep brown color. When the roasting is terminated the charge is raked from the furnace out to the floor of the establishment, from whence, after having been allowed to cool, it is removed for the purpose of being passed through a set of fine sieves, by which the finer powder is separated from the agglutinated lumps. These are broken down to a proper size, and after being mixed with a fresh quantity of sea-salt are again roasted in the usual way. The finer particles are, on the contrary, taken to a pair of heavy mill-stones, where they are reduced to the state of an impalpable powder. At the Halsbruecke works there are fourteen roasting furnaces, and as many pairs of granite mill-stones, which, together, are capable of preparing and grinding about seventy tons of ore per week. The ore, after passing through the mill, which makes from one hundred to one hundred and twenty revolutions per minute, is sifted through a dressing apparatus, which renders it as impalpable as the finest flour.

The reactions produced by the process of roasting are the following:—The sulphurets of iron and copper give off sulphurous acid gas, and are transformed into oxides and sulphates. The sulphuret of silver, on being heated in contact with the sulphates of iron and copper, is converted into sulphate, whilst these metals become oxidized, and sulphurous acid is evolved. The sulphates of iron and copper, together with the salt with which they are mixed, become fused even below a red-heat, and if sulphuret of silver be present in the mixture, a further amount of sulphurous acid is evolved, through the decomposition of that mineral, produced by the reaction of its sulphur on the sulphuric acid of the sulphates; whilst sulphate of soda, chloride of silver, and the chlorides of copper and iron, are formed at the same time. When these reactions are conducted with free access of air, the iron becomes partially converted into sesquioxide, whilst a corresponding amount of the sesquichloride of that metal is produced. The sulphurets of antimony and arsenic are likewise at the same time oxidized, and we may there-

fore regard the roasted ore as being composed of sulphate of soda, chloride of sodium, chlorides of manganese and lead, sesquichloride of iron and subchloride of copper, chloride of silver, sudry earthy impurities, and various metallic oxides.

The amalgamation of this prepared ore is performed in twenty wooden casks, arranged in four rows, and each turning on cast iron axles, secured to the ends by means of bolts. These barrels, which are two feet ten inches in length, and two feet eight inches in internal diameter, are made of oak staves three and a half inches in thickness, and are further strengthened by iron hoops and binders. On one of the ends of each is placed a toothed wheel, which works into another toothed wheel, mounted on an axle, which receives its motion directly from a water-wheel. Above each of the tuns so arranged is placed a wooden case, into which is thrown the prepared mineral, and which is furnished with a leathern hose, for the purpose of introducing the powdered ore into the different barrels. With this view, each cask is furnished with a circular opening, and an iron or wooden pin, which is employed for running off at the termination of the process, the argentiferous amalgam.

Hydraulic Cast Iron Pipes.

A new and useful feature for hydraulic mining and ditch proprietors has lately been introduced by the enterprising proprietors of the California Foundry, Messrs. Wm. Brodie & Co., in the casting of iron pipes for conducting water to mining claims and similar purposes. In an article addressed to the *Calaveras Chronicle* by its correspondent, we find the following description:

I called on the proprietors to learn the particulars as to the price, and to examine the pipe so as to judge from my practical knowledge in mining matters, the value of its use in hydraulic mining. The following is the result of my enquiries and observation:

I found them prepared to make four sizes of pipe that will bear a pressure of two hundred and twenty-five feet, at the following prices: Four inch, one dollar thirty per running foot; five inch one dollar eighty cents per foot; six inch, two dollars twenty-five cents per foot; eight inch, three dollars per foot. The pipe is coupled together by the flanges in nine feet lengths; Each set has all the necessary couplings and elbows to attach the hose. The couplings are so arranged but short time is needed to shift the pipes at any time. Every pipe is tested under the hydraulic presses before it leaves the shop, so there is no danger of delays from the bursting of imperfect pipes. All that is necessary in ordering a set of pipes, is to state the size wanted and the length. I would suggest to those ordering these pipes, to measure the depth of the bank down into the claim, as short joints can be made to suit. A heavy sheet iron reservoir of any shape or size can be ordered to go under the measuring box at the ditch. The cut off valves where the hose is attached, are perfectly tight, so that the water can be turned off instantly in case of accident, or to clean up; in fact the whole rig is complete, and just what the miner wants to work hydraulic claims, as it does away with the necessity of building high flumes, which are liable to be overthrown during heavy winds. Those who, like myself, have suffered from such damages, to say nothing of the expense, will appreciate the plan of substituting these pipes in place of the old flume. The cost over a flume and hose will be well repaid in one season, as all practical miners know that the best quality of hose that costs from \$1 62 to \$2 25 cents per foot, will not last over nine months with ordinary pressure. Another great advantage in the use of these pipes is, that every foot of pressure can be made available, and pipe that can bear a force of five hundred feet and carry two hundred inches of water, can be made for about four dollars per foot. Brodie & Co. are prepared to make pipe for reservoir tanks of any size desired, and from practical knowledge obtained by long experience in constructing reservoirs and tending ditches. I think that all who intend building permanent reservoirs would consult their interests by substituting these pipes in place of the wood culvers or trunks. I do not believe there is a ditch company in the State, but what has met with accidents enough from the bursting of tanks and losses from leakage of the gates to pay four times over for iron pipes; besides these pipes never rot. The gate is raised by a screw and is fitted into a groove like a valve; there is no packing about it, but the slides and gates are placed perfectly true, and ground in so that it is impossible for it to leak; then they have an air pipe to prevent a collapse in the trunk by foul air, or a vacuum being created. Twelve inch pipe of this kind can be had for \$6,00 per foot. The proprietors being old miners and ditch leaders, thoroughly understand the wants of the miners, and are prepared to do their work in a substantial manner.

INCORPORATION.—The articles of incorporation of the Daney Gold and Silver Mining Company were filed yesterday in the County Clerk's Office. The stock is fixed at 8000 shares of sixty dollars each; time of company's existence, 50 years; and place of mining, the Devil's Gate District, near Silver City. The first Board of Trustees are: Leo. Level, Wm. H. Sharp, John D. Wilson, Theo. Leroy, John M. Byrne, Geo. Servias and Ogden Hoffman.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the stand and work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, finely bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide," a compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work. It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character: and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

THE MINER'S COMPANION AND GUIDE.—In a recent notice of this invaluable work, we omitted to give some of its leading features of interest and value specially designed for our mining community and metallurgists. This book has been carefully prepared and published by the enterprising editor of the "Mining and Scientific Press," of San Francisco. It contains nearly one hundred fine illustrations, with three hundred pages of interesting and instructive matter, forming a neat little volume substantially bound, at the low price of two dollars. It is thus far the best mining work issued on this coast, having complete treatise on veins and lodes, timbering of mines, manual of metallurgy, the geology of California, and the most important of all, many new and interesting methods for separating gold and silver ores, and pyrites together with a glossary of technical terms not contained in any other work. The miners of this coast will find this an indispensable hand-book. Every California miner should possess it.—[Sac. Bee.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins, and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirty pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work is the "Miner's Companion and Guide," and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and we doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINER.—Our thanks are due to Mr. Silversmith of the Mining and Scientific Press, for a copy of the "Miner's Companion and Guide" being a compendium of most useful information, together with a glossary, giving the definition of all the terms made use of in the work many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's hidden treasures.—[Union Temperance Journal.

Mining Companies and Associations.

Office Dico Padre Gold and Silver Mining Company, 215 Front street, San Francisco, September 25, 1861.—Notice is hereby given that an assessment of one dollar per share on the capital stock of this company, was levied this day to be paid in installments at the office of the company as follows: Twenty-five cents per share, on or before the 25th inst.; twenty-five cents per share on or before the 25th October proximo; and fifty cents per share, on or before the 25th of Nov., 1861.
Shareholders will take notice that delinquent stock will be proceeded against in strict conformity to law.
By order of the Board of Trustees.
JOS. P. NOURSE, Sec'y.

Office St. Louis Gold and Silver Mining Company.—Notice is hereby given that the Board of Trustees of the St. Louis Gold and Silver Mining Company have, this 15th day of October, 1861, levied an assessment (for completing their mill) of two dollars upon each share of the capital stock of said company, payable to the Secretary, at No. 40, Montgomery Block, San Francisco.
By order of the Board of Trustees.
J. H. BREWER, Secretary.

Office of the Colo Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Colo Silver Mining Company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent on the capital stock of the company, being fifty cents per share, payable within thirty days to the Secretary of said company, at his office in this city. Shareholders at the expiration of thirty days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.
By order of the Board of Trustees.
J. B. COFFIN, Sec'y.

Office Dico Padre Gold and Silver Mining Company, 215 Front street San Francisco, October 29th, 1861.—A meeting of the stockholders of the Dico Padre Gold and Silver Mining Company, held at the office of the company, on Saturday, November 10th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.
JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 16th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 16th day of November, 1861, at the office of the company, in this city.
By order of the Board of Trustees.
JOEL F. LIGHTNER, Secretary.

Office Gould & Curry Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.
JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which was made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.
C. S. HUGGINS, Secretary.

Office Crown Point Gold and Silver Mining Company, 321 Front st., San Francisco, Oct. 23th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.
O. B. CRARY, President.

Office Norman Silver Mining Company.—Notice is hereby given to all stockholders in the Norman Silver Mining company, that an assessment of fifty cents upon each share of the capital stock of said company was duly levied on the 5th day of November, 1861, and is payable on or before the 10th day of December, 1861, to Chas. Ludington, at Virginia City, N. T., or to the Secretary of the company, at No. 40 Montgomery Block, San Francisco.
By order of Board of Trustees.
J. H. BREWER, Sec'y.

Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 10th of December next, at the office, as above.
J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 23th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City; or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.
By order of the Board of Trustees of S. N. S. M. Co.
J. H. BREWER, Secretary.

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.
All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.
JOS. H. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty sixty or ninety days from date, to the Treasurer of the company.
By order of the Board of Trustees.
JOS. H. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.
By order of the Board of Trustees.
HENRY S. HUDSON, Sec'y.

Office Chollar Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the Stockholders of this Company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.
W. E. DEAN,
Sec'y Chollar S. M. Co.

A Meeting of the shareholders of the Summit company will be held at the Gold Hill Bakery, in Gold Hill, on Friday, Nov. 15th, at 7 o'clock P. M.
Punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.
JOHN DOYLE.

Office Billion Gold and Silver Mining company, Van Horn District, 305 Montgomery street, San Francisco. Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock P. M.
T. L. BIRNINS, Sec'y.

Savage Gold and Silver Mining company. A meeting of the stockholders in the above company will be held at 10 o'clock, A. M., the 17th day of December 1861, at the office of Lent, Sherwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Morrow at Virginia City, or A. K. Head Nevada; or the undersigned before the 14th day of December next.
WM. M. LENT, President.

San Francisco, November 27, 1861.
Notice.—There will be a meeting of the Sides Gold and Silver Mining company, on Sunday, November 17th, 1861, at 11 o'clock A. M., at the house of M. H. Bryan, Virginia City.
A punctual attendance is requested, as business of importance will come before the meeting.
M. H. BRYAN, Sec'y.

Notice is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia City, N. T., on Saturday the 23d inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.
R. T. SMITH,
President Arizona Company.

Notice.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mina Rica," "Ginsaba," "Fortuna," "Santa Cruz," and "Naciamiento," situated near San Antonio, Lower California, Mexico.
CHAS. J. DUPRAT,
EM. LEYA,
DUPRAT, SCHMITZ & CO.,
CHAS. KRAFT & CO.,
La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California.
For further particulars respecting the above named mines, inquire of
JOS. J. DUPRAT,
423 Washington street.

LEWIS COFFEY & RISDON'S
STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Boiler Making Establishment on the Pacific Coast Owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market Streets.
Opposite Oriental Hotel, San Francisco, Cal.
LEWIS COFFEY, J. N. RISDON

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to give no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!
Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!
Will find an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!
Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!
This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.
To mail subscribers.—Four Dollars per annum.
Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.
For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post offices. Specimen copies will be sent gratis to any part of the country.
J. SILVERSMITH, Publisher,
Lock Box 537, P. O.
Rooms 20 and 21, Government House, Corner of Washington and Sanson streets, San Francisco.

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street near the Gas Works, San Francisco.
Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc.
The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing.

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000
IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.
The Books of Subscription are open at the office of Piche & Bayerque where the required first instalment of 10 per cent. will be received.
F. L. A. PICHÉ, President.
m28 J. H. APPIEGATE, Secretary.

WHEELER & WILSON'S

FAMILY SEWING MACHINES:
NOT ONLY
THE BEST FOR FINE SEWING,

..BUT THE BEST FOR..

MANUFACTURING CLOTHING

..AND..
OTHER HEAVY WORK.

SAN FRANCISCO, JUNE 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cassimers and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them cannot be surpassed.

Various styles of Machines have been employed on the above materials, but the Wheeler & Wilson is preferred.

DONALD McLENNAN,
Proprietor of the Mission Woolen Mills

A. ROMAN & CO.
Booksellers, Importers, Publishers,
507 MONTGOMERY STREET,
SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 200 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc., Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Rudimentary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lamborn.

The Discovery and Geomorph of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Disquisition on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....DEC. 7, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by
J. SILVERSMITH, Editor and Proprietor.
At Five Cents per month, or \$4 per annum, in advance.
Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.
Patrons will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York *World*, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the Press will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

Nevada Territory and its Wealth.

From present appearances we have reason to believe that this Territory will furnish or yield one million dollars per month very soon. Our correspondent in whose veracity we place the most implicit confidence, assures us that the extent of gold and silver bearing lodes have not even begun to be developed. The winter will for a short time stop the proceedings of mining except in tunnels. The preparations by mining companies next spring for working their ores and opening leads will exceed our estimation. The foundries and machine works in this city have been driven beyond their capabilities in furnishing mills and amalgamating machinery for that district, and to the exclusion of every other kind of work.

If report should prove true that lead leads exist sufficiently abundant there; it will be a god-send to them, and which will do away with the many new processes for separating the metals from their ores. Were we to enter into mining speculations we should lay more value upon a lead or galena mine than the richest silver mine!

In a letter to a contemporary from Gold Hill a writer remarks that the principal mining region of Washoe, as far as developed practically, at the same time, may be said to consist of the Comstock lead, and the parallel veins in the immediate neighborhood of Gold Cañon. These minor veins have not been fully tested, and no definite opinion can be

formed of their richness. But there can be but one opinion concerning the Comstock lead. It extends in an unbroken line from the Cedar Hill, a little to the northwest of Virginia City, to the southernmost extremity of Gold Hill, a distance of 6,000 or 7,000 feet. Wherever pierced this lode shows an average thickness of at least forty feet, and in many places, as for instance at the bottom of the main shaft of the Ophir, it expands to the width of over one hundred feet. It is a curious but well authenticated fact, that the Comstock lead upon the surface is very rich in gold, and poor in silver; but as the lead is pierced, the character of the rock undergoes a gradual change, until eventually traces of gold almost disappear, whilst the silver swells in value and volume, the deeper the ledge is opened. The face of the hills looking eastward in the vicinity of the Comstock lead, could be worked to great profit if water in sufficient quantities could be obtained. The loose or float quartz boulders everywhere dotting the surface of the ground are rich in gold, and many persons are engaged in collecting them and extracting the gold. A party of Mexican miners near Virginia City, obtain remunerative wages by breaking off from the external croppings of the main quartz ledge, selected pieces, and subjecting them to the usual method of crushing.

These facts indicate the richness of the ledge below far more certainly than any mere fine assays, or any partial working of the rock close to the surface. From all these indications as well as from actual experience, the opinion may be safely ventured that the Comstock lead, with its dips and angles and variations, is the richest, most extensive and most exhaustless of both gold and silver ever discovered. Centuries hence, it will be more productive than it is to-day, and in itself it contains the dormant wealth of an empire.

I am thoroughly convinced that the eastern slope of the Sierra Nevada is richer than the western, and that the day is not far distant when the bulk of the mining population of the Pacific will be concentrated between the Humboldt and the Yuba. California will be known to our posterity as an agricultural rather than a mining country, and the silver star will ere long eclipse the golden one for ever.

But let it not be concluded that fortunes are to be made here in a day, or a month, or that no reverses are in store for the adventurers who are thronging hither from every part of the world. The average yield of the quartz per ton—even in Gold Hill—has been greatly exaggerated, and few paying claims have been opened at all elsewhere. An impression prevails in California that the Comstock Lead, at Gold Hill—which sells at an average for over \$2,000 per foot—will yield from one hundred dollars to two hundred dollars per ton. This is a great error. The richest veins scarcely reach so high a figure, and the general average is set down by the most experienced miners and millers at fifty dollars per ton.

Hitherto the owners of ledges have not been able to erect mills to crush their own mineral. The consequence has been that a great many custom mills have been erected at every available spot from one end of the mining region to the other. It has been computed that there are already in active operation not far from seventy-five of these toll institutions, and that from fifty to seventy-five more are in process of construction. Some of these mills have as high as sixty stamps, capable of crushing seventy-five tons of quartz *per diem*. Perhaps the average would be twenty stamps with a crushing capacity of twenty-five tons per day. This would place the quantity of rock at over 1,500 tons, and the annual value at over \$25,000,000. This calculation excludes mine owners who crush their own rock. At present, the owners of mines are actively engaged in making preparations to erect mills for themselves. The result is apparent to all. A very large proportion of the custom or toll mills will fail; some of them are even now in a tottering condition, unable to obtain quartz or wood. Before spring comes you may look for a general crush amongst the proprietors of the class of property to which I have referred.

Our Mining Summary—its Importance Abroad.

We are gratified to announce that the weekly resume of our Mining Summary, which usually occupies the 5th page of the Press, is now quoted in many European and American Journals. The readers of the Press in this State are too familiar with items of this nature, hence pays little or no attention to this most important subject. As a faithful chronicle of mining and its products it is at present the only journal in the United States, but more especially of the

Pacific States. The facts and figures are collected from the most reliable sources, faithful correspondents of this State as well as from some of our able contemporaries.

The object we attain in bringing before the world those facts, is to stimulate an emigration to our shores from abroad, where peace, harmony, and wealth can be enjoyed, and that too, with comparatively little labor, when compared with the battling of an honest existence in other countries. We have rich and extensive gold, silver, copper, zinc, lead, coal, iron and other mineral districts yet laying dormant, but for the want of practical men to develop the same.

Plattner's Chlorine Gas Process.

We have just sent to the Patent Office through the Patent Agency of this journal the drawings and description of improvements on the apparatuses used in Plattner's process for extracting gold from pyrites. Mr. G. F. Deetken, mining engineer at Nevada, has, after a long series of experiments, succeeded in bringing the process into a useful and practicable shape for the Pacific States. This is the only process that will save every particle of gold, as he will demonstrate by ocular proof. In a recent issue we gave a synopsis of this process, and we are glad that its introduction into this State has been effected. This process is invaluable for the Pacific States. Had we the means we should avail ourselves of the patent in preference to publishing a mining journal.

The World's Fair.

Governor Leland Stanford has been appointed a Commissioner for the State of California, in the World's Fair, to be held in London in 1862. We are glad that the general government has made this provision. The different societies in Science and Mechanics had held meetings heretofore electing commissioners, some of which left soon thereafter, and did nothing to secure a full collection of articles or products from this State for the exhibition, leaving that to minor committees.

It would certainly be desirable to have at least a large mineral collection from this country, which will go a great way in verifying the truths of statements with reference to our metallic wealth. We should also like to see Professor Whitney in presenting them at this fair. The State collection already numbers some twenty or thirty closely packed cases of specimens, which will no doubt make a respectable and grand exhibition.

We have received the first copy of the *El Dorado Times*, published by Messrs. Geo. Kies & Co., at Placerville. We have of late missed the *Coloma Times*, which is thus replaced by a handsome readable, and apparently promising interior journal. In its sentiments it is for the Union—and contains twenty columns of well written and selected matter—but no mining news! If the enterprising editor or publisher of the *Times* has the interest of his county at heart, or loves the MINING AND SCIENTIFIC PRESS, he or they will furnish us at least with a column of such items every week; they will thereby place us under obligations, and bring this county into immediate renown for its metallic riches, which we know it possesses. You can do this brother *Times* by making the rounds in the camps and profit by an agreeable interview with the intelligent miner.

Bancroft's Almanac for 1862.

The above little hand book has been laid upon our table, and presents a neat volume of interesting reading matter, statistics, tables, State, City and County affairs—the compilation of Mr. Wm. H. Knight. We recommend it to the public.

La Porte and Vicinity.

The Mountain Messenger says the recent rain storm started an ample supply of water for drifters, and by next week we expect to hear of some heavy yields from the enormous piles of pay dirt which have prospected so well in our neighboring towns. If the weather continues favorable for six or seven days in succession, a sum of not less than \$300,000 will be washed out in Northern Sierra. Besides the benefit to be derived from the circulation of so large an amount of money in our midst, the miners will be able to continue their drifting through the winter months, while they otherwise would have had to suspend operations for want of space to dump their dirt. This opportune season of water will add materially to the prosperity of the coming year, in this community.

SUMMARY OF MINING NEWS.

To Miners and Mill Owners.

Respectfully request all persons interested in the Mines, Quartz Mills, or in any prospecting expedition; also the orders of the different mining districts to forward to us all notices, such information concerning the condition etc., of the mines and mills in their vicinity, and description of lodes, as they may think will prove interesting or useful to the public, for publication. Records of mining districts will be oblige by sending us their address.

CALIFORNIA.

Placer county.—We clip the following from the Placer Herald: A man by the name of Ali Baki, found a lump of gold on Tuesday evening, which is estimated to be worth about \$2,000. It weighs ten pounds and is a piece of gold, a little mixed with quartz, perhaps to the extent of six or eight ounces. The chunk was found in a lot in the suburbs of the town in the track of an old road, where the wagon had run over it. The man, who was an Arab, while the lucky Chinaman smiles complacently at his luck. An able exchange—the Dutch Flat Enquirer—has the following: We regret to learn, says that Journal that the Dutch Flat Water company broke on Monday last about one hundred feet, caused by a slide. The place at which it broke is about eight miles from here, and it is thought that from under the rocky feet of the mountain, water has been forced out. This is extremely unfortunate, especially at this time; causing the company considerable loss in water, besides expense in burning the broken rock and retarding the operation of a large number of our miners, nearly all of whom are now ready to commence operations.

Yuba county.—An excellent correspondent writes from Little Fork to the Enquirer that county as follows: The lodes are quite interesting. As a brief sketch of the mining interests of this district may interest your many readers, in this section I submit the following in relation to our mines. I will commence with the large pipe recently constructed by Joseph Gardener, of this place, which extends from Christmas Hill to Mandocia Hill, a distance of three thousand eight hundred feet. The following will show the size of iron of which the pipe is made, as also the size: 2,200 feet of pipe made of No. 16 iron: 900 feet of No. 18; four hundred feet of No. 20; 150 feet of No. 22; 150 feet of No. 24; 150 feet of No. 26; 150 feet of No. 28; 150 feet of No. 30; 150 feet of No. 32; 150 feet of No. 34; 150 feet of No. 36; 150 feet of No. 38; 150 feet of No. 40; 150 feet of No. 42; 150 feet of No. 44; 150 feet of No. 46; 150 feet of No. 48; 150 feet of No. 50; 150 feet of No. 52; 150 feet of No. 54; 150 feet of No. 56; 150 feet of No. 58; 150 feet of No. 60; 150 feet of No. 62; 150 feet of No. 64; 150 feet of No. 66; 150 feet of No. 68; 150 feet of No. 70; 150 feet of No. 72; 150 feet of No. 74; 150 feet of No. 76; 150 feet of No. 78; 150 feet of No. 80; 150 feet of No. 82; 150 feet of No. 84; 150 feet of No. 86; 150 feet of No. 88; 150 feet of No. 90; 150 feet of No. 92; 150 feet of No. 94; 150 feet of No. 96; 150 feet of No. 98; 150 feet of No. 100. The diameter of the pipe is for 4,200 feet, 18 inches; for one hundred feet, 16 inches; for one hundred feet, 14 inches; for one hundred feet, 12 inches; for one hundred feet, 10 inches; for one hundred feet, 8 inches; Quartz.

The numerous varieties of this mineral are composed almost exclusively of siliceous, and occasionally some little water: but the peculiarities in the appearance of many of them are occasioned by the presence of substances differing from quartz in character and composition. They are hard enough to scratch glass, do not yield to the knife, and are infusible before the blowpipe. When crystallized the form of quartz is a six sided prism, terminated by six triangular planes, but the primary form is rhomboid. The following are the principal variety of quartz:

Rock Crystal.—This term is applied to the large and transparent crystallizations of quartz, of which substance they present the purest variety. The finest rock crystals occur in mica-slate at Dauphine, in the Alps, grouped together in most magnificent masses; and from a capital though small specimen from this locality we found it was very rich. Exceedingly transparent crystals, also, are found imbedded in the carraira marble; accompanying Brookite of Snowdon, in Wales; at Tigtigel, in Cornwall, and in America, in Herkimer County, New York.

Very beautiful iridescent appearances are sometimes observable in rock crystals, which are most generally produced from fracture in the specimen. They also frequently contain other substances imbedded in them, such as oxide of iron, titanium, asbestos, shorl, &c.; and in the possession of Mr. G. B. Sowerby, is a most remarkable rock crystal, which encloses fine hair-like asbestos, transversely arranged, and forms a perfect six sided prism and pyramid, corresponding with the form of the crystal which contains it.

From the most clear and transparent specimens of rock crystals are made glasses for spectacles, which are considered superior to those manufactured of glass.

Common Quartz.—The varieties of quartz to which this term is applicable, differ from the preceding in being more or less opaque. When crystallized they assume the form of a six sided prism, which is occasionally terminated at both ends by a six sided pyramid. Sometimes too, these pyramids meet completely, so that no portion of the prism being visible, the form of the crystal is a perfect dodecahedron with triangular planes. Mr. Wright collected many crystals of this form, and of a smoky hue, accompanying Oligiste iron in Cumberland; in which locality also occurs the pink variety of double-pointed quartz, so common in all collections.

An interesting instance, showing that although the laws of nature are perfect, they are not only liable to considerable modification, but that accidental circumstance may produce such changes in the form of a mineral substance, that those who have not made these laws their study would scarcely recognize it, may be seen in Babel quartz—so termed because its crystals appear at first sight to be composed of distinct hexagonal layers, heaped one upon the other, gradually diminishing in size as they approach the surface, and thus the tout ensemble bears some resemblance to the representations we have seen of the far famed tower of Babel. This appearance is owing to the regular process of crystallization of the quartz being interrupted by a similar process which is crystallizing the fluato of lime into the cubes, which are characteristic of flour-spar; for though in the specimens of Babel quartz we see only quartz crystallized in cubic spaces, and that this crystallization of one substance against the other, prevented either from developing the form peculiar to it.

Crystallized common quartz occurs of almost every color: at Haytor, in Devonshire, of a deep black hue, and generally opaque; at Snowdon, very exquisite crystals occur, in which delicate milky clouds appear, and which hence are termed milky quartz; at Cairngorm, in Scotland are found specimens of a rich wine yellow color, which, when fine, are used in jewellery under the name of Cairngorms. But as it will not be possible to mention all the different colors observable in crystallized quartz, we will content ourselves by alluding to those which are most distinct.

Smoky quartz was long supposed to be peculiar to the Mourne Mountains in Ireland, where it was commonly found accompanying the very fine beryls formerly pretty abundant, but now almost extinct in that locality. We possess, however, a good crystal of this variety, from Australia, and believe that it is also found in other localities.

Eisenkiesel is a variety of quartz which occurs both crystallized and massive, and derives its ferruginous appearance and yellowish-red color from the presence of a considerable proportion of iron. It is found in Bohemia, in ironstone veins in the Hartz, in Upper Saxony and Siberia. In England it occurs near Bristol; in Scotland and in Ireland.

Amethyst, the most beautiful variety of quartz, derives its lovely purple tint from the admixture of a very small proportion of iron and manganese, but loses this color by long exposure to heat. This mineral is largely used for the purpose of jewellery, and indeed we know of no other stone whose color forms so splendid a contrast with that of the gold in which it is usually set. The finest stones for this purpose are brought from India, Siberia, and Spain. Most splendid cabinet specimens are brought from Bohemia, Transylvania, and Oberstein in Germany.

Cumus Action of Silver.—Professor Boettger states that if dry oxide of silver is moistened with essence of cloves, the mixture takes fire and the metal is reduced.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munn & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of Inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LAT. COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

ap25

CHESAR MASON

DEVORE & CO.,

STEAM ENGINE AND MACHINE WORKS,

Corner Market and Fremont sts., San Francisco.

All kinds of machinery, such as Steam Engines, Sawmill Irons, Flour Mill Quartz Mills, etc., etc., made to order and repaired.

—AND—

BLACKSMITHING,

Turning, Finishing, Planing, and Screw-Bolt Cutting.

AGRICULTURAL MACHINERY

Of all descriptions, made and repaired.

Duplicate parts of THRESHING AND REAPING MACHINES, and THRESHING TEETH, made to order on the most reasonable terms.

STEAM ENGINES AND BOILERS,

Constantly on hand, and for sale cheap.

Screw-Cutting Turning Lathes for sale.

jy27

DEVORE & CO.

Zur Beachtung für Erfinder.

Erfinder, welche nicht mit der englischen Sprache bekannt sind, können ihre Mittheilungen in der deutschen Sprache machen.

Stützen von Erfindungen mit kurzen, deutsch geschriebenen Beschreibungen beliebe man zu adressiren an.

Die Expedition dieses Blattes.

PHILADELPHIA BREWERY,

Second street, corner of Folsom, SAN FRANCISCO, CAL.

Hölscher, Wieland & Co. Proprietors.

Thankful for past patronage to a discriminating public, we beg leave to announce at the same moment our many friends and patrons that the above well known Brewery has been permanently located in our new premises, on Second street—the former residence of Capt. Folsom, where we shall endeavor to continue in furnishing our numerous patrons with the best article of "Beer." We shall strive to perpetuate the good reputation for promptitude and the faithful execution of orders as heretofore, and thereby increase our custom.

Nov5.

WALSH, L. PALMER.

THOS. FENDERCAST.

J. O. HANSCOM

PALMER & CO.

GOLDEN GATE IRON FOUNDRY.

No. 6 Battery Street, SAN FRANCISCO.

Particular attention paid to the MANUFACTURE of

KNOX'S AMALGAMATORS, QUARTZ MACHINERY, MANTEL CRATES, STOVE WORK, CALDRONS, ETC.

We also Manufacture

IRON CASTINGS, OF ALL KINDS.

AGENCY FOR PATENTS.—The undersigned having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office, Washington, offer their services for the securing of Caveats and Patents, also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,
Office, 410 Montgomery street

CHARLES R. BOND, (Late City and County Assessor.)

REAL ESTATE AGENT,

410 Montgomery street, San Francisco.

REAL ESTATE PURCHASED AND SOLD, LOANS NEGOTIATED

PACIFIC METALLURGICAL WORKS.

NORTH BEACH,

Are now prepared to reduce by contrast, Gold or Silver Ores or Sulphur. Price of reducing will be as low as the charge of similar establishments in Europe or in the States, thereby saving freight, insurance and interest.

BRADSHAW & CO., Agents,
Cor. California and San.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$4,520 3 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,273 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of this state at large. The charges are as follows:

For parting silver from gold when gold is below 300—1000ths fine. 3cts per oz.
" " from 300—1000ths to 750—1000ths fine. 7cts " "
" " 750—1000ths to 950—1000ths " . 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16—4—11ths cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITOR FOR DOLLARS.

\$1 16—4—11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITOR FOR IMPORTED BARS.

\$1 16—4—11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.2 per standard oz., and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver registers as most congruous with the physical aspects of the material but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rate and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PATENT

WIRE ROPE MANUFACTURERS

—AND—

Wire Suspension Bridge Builders.

OFFICE: WORKS:

12 Clay Street, North Beach,

THE ROPE IS FORTY PER CENT. LIGHTER, LESS THAN ONE HALF THE DIAMETER, AND SIX TIMES AS DURABLE AS MANILLA OR HEMP ROPE OF EQUAL STRENGTH, AND IS UNAF- FECTED BY CHANGE OF WEATHER.

It is more particularly adapted for

FERRICK GUY ROPES, FERRY ROPES

And for hoisting from Deep Shafts and Inclined Planes.

Shipping Companies or Ferry Owners, who use rope for winding, hoisting, or other purposes, will effect an immense saving by ordering WIRE ROPE through our Agents.

Circulars, with scale of weights, sizes, strengths, and list of prices and will be forwarded to those interested, who can then compare the cost of Wire and Hemp Rope, by addressing the manufacturers.

SUSPENSION BRIDWORK!

SUSPENSION BRIDGES, Aqueducts, Etc., erected on moderate terms PERMANENCY GUARANTEED.

PALTENGHI & LARSENEUR.

Between Street [Old Nos. 130, 132; New Nos. 422, 424].

**MARKET STREET RAILROAD**

During the week cars run from SAN FRANCISCO TO MISSION AND WILLOWS:

From 6½ A. M. to 11½ P. M.
From 6 A. M. to 11 P. M.
Connecting with the Hay's Valley Car and Lone Mountain Omnibuses, from this date.

SUNDAYS AND FEAST DAYS—

A new set of large and convenient cars will be added for the accommodation of the public.

F. L. A. POCHE, Trustee.

A SPLENDID OPPORTUNITY.**AGRICULTURAL MACHINERY.**

I have taken, for five years, a large portion of the State Prison Labor, for the sole purpose of manufacturing

AGRICULTURAL IMPLEMENTS AND CABINET WARE

For sale, at a Great Sacrifice, in order to close out my present stock on Monday First, 1861, the following articles:

WELVE-HORSE STEAM THRESHERS;
M. RUSSELL'S EIGHT AND TEN-HORSE THRESHING MACHINES.
A. PITT'S GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND TWELVE-HORSE POWER, with all of C. M. Russell's Latest Improvements;
RAY PRESS, REAPERS AND MOWERS;
EPA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE RAKES.

All the above goods will be sold at the Lowest Prices, either for Cash, or on approved paper at a low rate of interest.

THOS. OGG SHAW,
33 Sacramento Street.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to the extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheap and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp-chutes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months; Mining Pumps of all sizes and kinds; Flouring Mills, Gang, Sash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hancock's Amalgamator; Goddard's Typ, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Our Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Saut Mills; Bolter Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steadfast work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO**ADVANTAGES**

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient in the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and knives, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing. **KNAPP, BURELL & CO.,**

Manganese.

Although in usefulness this metal will not bear comparison with iron, it is yet of considerable importance in some of the arts and manufactures. It has never been found in a pure state, but in all its ores is in combination with Oxygen, and when in this state is turned to great account for the purpose of obtaining oxygen gas from it for the manufacture of bleaching powder. Oxide of Manganese has already been used in the manufacture of glass, in order to render it colorless. This metal has not long been known.

GREY MANGANESE.

The primary form of this substance is a rhombic prism, from which the crystals in which it usually occurs are derived. The crystals are often of considerable size, and are of a greyish-black color and very brilliant. It is also found in long slender prisms aggregated together, having in the mass a fibrous appearance. From Thuringia are brought the finest crystallized specimens, but of the latter variety very good ones are found in Cornwall. The specimen is termed Black Manganese merely in allusion to its color, and exhibits another variety of the oxide of this metal, whose botryoidal. An earthy variety is found in several localities, and is called the euphonious name of Wad. Braunitz, Hausmannite, and Pyrolusite are other varieties in which oxide of manganese occurs; indeed, the last of those three is the one principally in use in the purification of glass.

ROSE MANGANESE.

There are several ores of manganese to which this name might be applied with equal justice as that of carbonate of manganese. This, which is from Nagyag, in Transylvania, is of the delicate rose color. The crystals are rhomboids, generally curved more or less, and occur lining cavities in sulphuret of manganese, which is of a black color. The other rose-colored ores of this metal are the silicate and the bisilicate: this latter is found massive in Devonshire, associated with the grey and black oxides; also in other localities.

HELVINE.

This is very different in general character from any other ore of manganese, occurring in tetrahedral crystals of a light brownish green color. It contains in addition to the oxides of manganese and iron, the earths, silica, alumina, and Glucine. The best known localities for it are Schwarzenberg, in Saxony, and Horte-kulle, in Norway.

To find the Proportions of Gold in a Mixture of Gold and Quartz.

(From the Miners' Companion and Guide.)

The specific gravity of the gold = 19.000

The specific gravity of the quartz = 2.600

These numbers can be corrected when experiment shows the specific gravities to be different.

A. Ascertain the specific gravity of the mixture of gold and quartz. Suppose it to be 8.067.

B. Deduct the specific gravity of the mixture from the specific gravity of the gold; the difference is the ratio of the quartz by volume:

$$19.000 - 8.067 = 10.933$$

C. Deduct the specific gravity of the quartz from the specific gravity of the mixture; the difference is the ratio of the gold by volume:

$$8.067 - 2.600 = 5.467$$

D. Add these ratios together, and proceed by the rule of proportion. The product is the per-centage of gold by bulk.

$$10.933 \times 5.467 = 16.400$$

$$16.4 \text{ is to } 5.467 \text{ as } 100 \text{ is to } 33.35$$

E. Multiply the per-centage of gold by bulk, by its specific gravity. The product is the ratio of the gold in the mixture by weight:

$$33.35 \times 19.00 = 633.65$$

F. Multiply the per-centage of quartz by bulk, by its specific gravity. The product is the ratio of the quartz in the mixture by weight:

$$66.65 \times 2.60 = 173.29$$

G. To find the per-centage add these ratios together, and proceed by the rule of proportion:

$$733.65 \times 173.29 = 806.94$$

$$806.94 \text{ is to } 633.65 \text{ as } 100 \text{ is to } 78.53$$

Hence a mixture of quartz and gold, having the specific gravity of 8.067, contains 78.53 per cent. of gold by weight.

The Funeral of Gen E. D. Baker.—Special Notice.—

The flags of the military escort will be carried and covered with crape, and all other flags and banners of the various Societies, Fraternities and Associations will be entirely covered with crape.

The mourning badges will be crimson, two inches wide, covered with crape, and with crape bows, worn on the left arm just above the elbow. Funeral badges can be seen and procured at Norcross's.

Badges for Committee of Arrangements, officers of the Army and Navy, Pall-bearers, Marshals and Aids, Judges of Courts, members of Senate and Assembly, Mayors and others, specially invited, will be furnished by the Marshal-in-Chief, on the morning of the funeral.

J. D. STEVENSON, Marshal-in-chief.
F. A. WOODWORTH, Special Aid.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been limited:

Potosi, \$25 per foot.
Central, \$550 per foot.
Ophir, \$850 per foot.
Gould & Curry, \$330 per foot.
Chollar, \$50 per foot.
Lucrae, \$35 per foot.
St. Louis, \$15 per foot.
Sacramento, \$25 per foot.
Yellow Jacket, \$110.
Monte Cristo, \$5.
Succor \$15.
Cole, \$30 per foot.
California, \$400 per foot.
Durgen, \$10.
Miller, \$12

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucrae, 1; issue, \$500 per share.

[Having completed all the requisite arrangements we lay before our readers a reliable list of prices of mining stocks of Utah.]

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH,
GOVERNMENT HOUSE,
SAN FRANCISCO.

N. B.—R. W. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will hereafter transact all business pertaining to patents for us, at the patent office in Washington city. For instructions and the new law regulating patents, we refer the inventor to the above.

Miaers, Inventors, Agriculturalists, Capitalists and Mechanics, will find it to their advantage to subscribe the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

UNION IRON WORKS (ESTABLISHED IN 184

N. E. Cor. First and Mission streets, San Francisco.

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the twelve years, during which time new and extensive buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS MACHINERY AND CASTINGS,

Of every description, on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Powers, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work; Steamboat Repairing and Blacksmithing, etc.
STEAM ENGINES BUILT AND REPAIRED.

Besides the extensive assortment of Machinery Patterns, attention is given to the new and beautiful designs for Building Castings, Iron Fronts, Grates for Stoves, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, Etc.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & G. M. WOODWARD'S PATENT.—This Pump is used for supplying Steam Boilers, Mills and Public Buildings, with water. In case of Fire arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the Discharge Outlet. It is suitable both for Maritime and Mining purposes, being used on nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED.
PETER DONAHUE, Proprietor.

OILS AND LAMPS BY LATE ARRIVALS.

STANFORD BROTHERS HAVE RECEIVED

A GREAT VARIETY OF COAL OIL LAMPS of every style of BUILDING known to the trade.
BRACKET LAMPS AND SIDE LAMPS with the largest burners in use.
PARLOR AND STAND LAMPS—An endless variety of Patterns.
CHAMBER LAMPS AND MANTLE LAMPS—Very cheap; may be had about.
CHANDLERS AND LANTERNS.
CAMPFIRE LAMPS OF ALL KINDS.
COAL OIL AND CAMPFIRE WICKS.
CHIMNEYS, SHADES, GLOBES—Of every size, style and finish.

200 BARRELS SPERM OIL—At a lower price than ever before sold in this city.
100 BARRELS LARD OIL—Of our own importation.
600 TUBS RAPE SEED OIL—In original packages.
100 BARRELS BOILED LINED OIL—guaranteed pure and free from Soot.
400 CASES DOWNHILL'S KEROSENE.
500 CASES COAL OILS—At the very lowest market prices.
1,000 CASES CHINA OIL—In 2½ gal. tins.

We feel confident in assuring our CUSTOMERS and the TRADE generally, that they will find our assortment of LAMPS and LAMP STOCK, as well as of OILS and all kinds of BURNING MATERIALS, the most complete that has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms; we are determined to fix our prices at a standard so low that dealers in line of goods can buy in their Winter Stocks, and have a wider margin of profit than they have ever had before.

SAN FRANCISCO, SATURDAY, DECEMBER 14, 1861.

NO 13.

PERRY'S IMPROVED MACHINE FOR PREVENTING ACCIDENTS AT MINE SHAFTS.

Mr. E. C. Perry, of Sedgley, Stafford, has obtained a patent for improvements in preventing accidents in or at mine shafts.

This invention consists firstly, of the machinery or apparatus represented at figures 1 and 2 of the above engraving, which suspends or arrests the mine skip or cage, if by the breaking of the chain or otherwise, the cage becomes detached from the winding apparatus. On opposite sides of the shaft, conducting slides or guides are fixed, as shown, on the sides of which a series of teeth or steps are formed, extending from the top to the bottom of the mine shafts. The upper sides of the said teeth or steps are nearly horizontal being inclined from their ends downwards towards the slide, as clearly seen in fig. 3. The cage is suspended in an outer casing, being connected to the chain in the following manner: On the top of the said outer skip a column is fixed, to the summit of which two levers are jointed, the levers crossing one another after the manner of a pair of forceps or scissors. The upper ends of the levers are connected by a chain, to the middle of which a mine chain is fastened. The lower end of each lever is connected, by means of a connecting rod, with a bolt, which slides horizontally on the top of the outer skip. The end of each bolt is forked, and is of a size and shape suitable for embracing the before-mentioned slides. When the skip is suspended to the mine chain, the said levers are nearly parallel, somewhat similar

to a closed pair of forceps, and the sliding bolts connected with their lower ends do not project over the sides of the outer case. When the mine chain breaks, or the cage becomes detached from the chain, the levers open after the manner of an open pair of forceps, and the bolts are shot out and made to embrace the slides and engage with the teeth, the skip being thereby suspended in the shaft. The opening of the levers on their detachment from the chain is effected by means of weights attached by means of nearly horizontal arms to the upper part of each lever. The opening of the levers is further secured by the method employed to connect the cage to the outer case. This is effected by means of four vertical rods joined at their lower ends to the cage. These rods pass through the top of the outer case, and their upper ends are jointed to the arms carrying weights. The opening of the levers and the shooting of the locking bolts is further secured by means of bow springs placed between the upper arm of the levers, or between both the upper and lower arms. Immediately the levers become separated from the mine chain, the springs which had been before compressed now expand and secure the opening of the levers, and the the shooting of the safety bolts.

The invention consists, secondly, of a self-acting cover for mine shafts, constructed as follows:

The cover is dome-shaped, as represented at figs. 4 and 5, and has at its summit an opening through which the winding chain passes. The edges of the opening have anti-friction rollers. The dome is capable of rising and falling upon

four vertical guide rods. As the skip rises under the dome it is lifted by it. The dome is supported in the following manner:

As the dome rises it strikes an arm or lever, which gives motion to mechanism which projects a bolt underneath the dome, and supports it as the skip descends. In order to liberate the dome when the skip is about descending to the mine, the skip in rising again strikes the said arm or lever, by which action the bolt is withdrawn, and the dome is at liberty to descend to the pit's mouth.

Another part of this invention consists of mechanism for preventing the skip from being drawn over the pulley, as shown at fig. 6. Two crossing levers, turning upon a common centre, are connected at top by a chain, to the middle of which the pit chain is fastened. The lower arms of the levers is of a semi-elliptical figure, their concave sides being presented to each other. When the levers are closed their lower arms constitute an elliptical ring, to which the skip is hung. When the levers open the skip falls. The levers are kept closed by means of levers jointed to each lower arm, engaging with projections on the opposite arm. The last-described levers are supported in their engaged horizontal position by means of springs. Somewhat below the pulley is a ring, through which the chain passes, and when the skip is raised almost to the pulley the levers strike against the ring, and are thereby disengaged from the projections. The arms open, and the skip is detached from the chain. The skip or cage is supported by the machinery herein first described, or by other machinery having a like action.

Manufacture of Malleable Iron and Steel.

Five years have now elapsed since Mr. Henry Bessemer startled the scientific and industrial world with the announcement that he had discovered a process by which iron could be manufactured without fuel; and although at that time his researches had evidently not been carried sufficiently far to warrant so bold an assertion, it cannot be denied that the iron trade is deeply indebted to him for having turned attention to a method of "nature-smelting," which will, doubtless, lead to increased economy in the production of iron. As might have been expected in the development of an invention, the adoption of which involved so complete a change in all existing notions, the difficulties and obstacles which Mr. Bessemer has met with have been almost innumerable, but with an amount of endurance and perseverance which reflects the highest credit upon him, he has surmounted them as they presented themselves, and has at length succeeded in approaching very nearly to perfection.

Amongst the latest difficulties which Mr. Bessemer has succeeded in removing is that which relates to the destruction of the tuyeres. In the manufacture of malleable iron and steel by this pneumatic process, it has been found that the powerful heat generated at or near the orifices of the tuyeres, together with the chemical action of the slags or oxides of iron and silicon, has the effect of enlarging these orifices, and in a short time rendering the tuyeres unfit for further use. The tuyeres, when thus worn, have to be replaced by new ones. The fitting in of these new tuyeres by the plan at present practised renders it necessary first to knock out the old ones, and then to cool down the converting vessel, after which the new tuyeres may be inserted in their places, and the spaces around them filled up with a plastic matter or "grout," which is generally composed of powdered "ganister" mixed with water; after this is done a fire is lighted in the converting vessel, and the wet parts thereby properly dried, and the interior of the vessel again highly heated before the process of conversion can be repeated, the change of tuyeres thus rendering the apparatus incapable of being used for several hours. The mode in which Mr. Bessemer overcomes these difficulties is by employing a form of tuyere which is capable of being replaced by others rapidly, and with little labor, as soon as worn out. His improved tuyere consists of a number of wings or discs of fire clay, Cornish clay, plumbago and fire-clay, "silica clay," silicates of magnesia, or other suitable refractory substance; these rings have a central hole in them, through which a stout steel or iron rod passes. There are also several other holes made through them at a small distance from the central one, which holes are for the purpose of allowing air to pass through each ring, or a circular brick is put on to the iron rod, and some fire-clay or other "lute" or plastic matter is put between them so as to make a tight joint. The surfaces of each disc may be ground flat, or they may be moulded with concentric grooves, and with corresponding raised rings or ridges alternately so as to fit closely, and assist in holding each other together. A long column is thus to be built up upon the rod, the air passages in each piece being so placed as to form continuous tubes throughout the whole length of the column or tuyere. At the lower end a larger ring is put on, having other holes around its periphery communicating with those before mentioned, the upper part of the column or tuyere being surmounted with a disc larger in diameter than the rest, for the purpose of filling up the orifice in the vessel through which the tuyere is inserted. The upper end of the iron end on which the tuyere is built passes into a metal cap, so made as to be readily fixed to and form a close joint with the blast-pipe; the different pieces constituting the tuyere are pressed together by a powerful spiral spring, which allows the necessary expansion of the rod and its rings. While they are firmly held together under a regulated pressure, the lower enlarged ring in which the tuyere orifices are formed may be perforated with numerous small holes, or with a lesser number of holes of a larger size, or in lieu thereof the air may be made to escape between flat or grooved discs, or from a hollow or bell-shaped cavity formed beneath the centre of the tuyere, but he prefers to employ circular orifices of $\frac{1}{2}$ in. or $\frac{3}{4}$ in. in diameter. For a charge of 2 tons of crude metal, forty $\frac{1}{2}$ -in. or twenty $\frac{3}{4}$ -in. orifices will suffice, when the blast is used at 7 lbs. or 8 lbs. on the square inch. As a general rule, he prefers in this form of tuyere to direct the jets of air horizontally, or at a slight angle downwards, but the openings may be so made as to direct the jets in any other direction, either upward or downward, or at a tangent to the axis of the tuyere, so as to cause a rotation of the metal in the vessel. In lieu of the several air passages formed around the iron rod, one large central hole may be employed with the rod passing also down it, or several rods may pass through separate holes in the rings instead of one in the centre. Slight modifications of this arrangement may, of course, be introduced to meet the varying circumstances.

To provide for the introduction of any necessary flux or alloy into the metal under treatment a globular vessel furnished with one stop-cock between the vessel and the tuyere, and another between the vessel and the external air is employed; fluids, as well as granular or powdery matter, being introduced by this means with the greatest facility; and Mr. Bessemer also proposes to give motion to the converting vessel by means of a hydraulic ram or plunger, moving vertically in a cylinder, and placed below the axis of the vessel, the ram or plunger being raised by the pressure

of water from any elevated tank or vessel under pressure, and again lowered by allowing the water to escape from beneath it; this motion of the ram is communicated to the axis of the converting vessel by means of a wire-rope attached to the ram, and passing round a grooved pulley keyed on to the axis of the vessel; a second wire-rope suspends a counterbalance weight on the opposite side of the pulley; this weight may be about equal to one-half of the weight of the ram or plunger, so that whenever the ram is raised the lowering of the counterweight will cause the vessel to turn round, while the lowering of the ram will raise the counterweight, and turn the vessel in the opposite direction. These movements will be under the control of the workman who admits or discharges the water from the apparatus by a suitable valve and handle. The vessel may thus at any time be made to discharge its contents, or he put into a position suitable for running in a charge of crude metal. In pouring out the fluid iron or steel from the converting vessel, the spout or opening from which the metal flows is moved (as the pouring proceeds) away from the spot where the pouring first commenced; the casting crane is, therefore, provided with a suitable sliding motion. Both cast-steel and malleable iron, when in a molten state, frequently disengage gases so rapidly as to flow or boil over the tops of the moulds in which they are poured, and thus form ingots or castings containing numerous cells. Mr. Bessemer has now found that this tendency of the metal to disengage gases and boil spontaneously is counteracted by the employment of a very small quantity of the metal silicon, 1 lb. in weight of which is sufficient when diffused through 2000 lbs. of molten steel to destroy this tendency to ebullition, and cause the metal to lie quietly in the mould.

About the year 1839, Josiah Marshall Heath discovered that metallic manganese also had a powerful effect upon molten steel if alloyed therewith to the extent of 1 per cent.; he found that it conferred on the steel so alloyed the property of welding and working more soundly under the hammer than steel not so alloyed. The result of this discovery by Heath has been the almost universal application of manganese to the manufacture of cast-steel. It, however, happens that both the metals silicon and manganese are difficult of reduction in such quantities as are required for commercial purposes, and when found naturally alloyed with iron the latter metal is in such excess as to cause many disadvantages in its use in alloying steel with those metals. But Mr. Bessemer has found that the metals manganese and silicon may be readily reduced in combination with so small a quantity of iron as to facilitate their application instead of causing an inconvenience by any excess of iron or carbon present, as in the natural alloys of these metals with pig-iron. For the purpose of making an alloy easy of reduction from its ores or oxides, and especially suitable as an alloying metal, he takes by preference from 30 to 70 parts of pure hematite or magnetic iron ore, and 50 parts of grey or black oxide of manganese; or he takes mangancium iron ore, and adds to it as much grey or black oxide of manganese as may be desired, and if silica he not present in these oxides, he adds five parts of powdered flint, or such quantity of a silicious iron ore as is equivalent thereto; to these materials he adds about 40 parts of pure anthracite coal, or other pure, or nearly pure, carbon; he then crushes these materials under edge-stones, or between crushing-rolls; the materials thus become thoroughly mixed and incorporated, and may then be deoxidised or cemented in fire-clay retorts, such as are used for gas making, or in the chests of an ordinary steel-converting furnace, and after cooling down may be sprinkled with or immersed in coal tar, or other hydrocarbon, preparatory to the smelting of the metallised mass in crucibles, and which crucible he by preference fixes in an air-furnace, where they may be surrounded with coke, as practised in furnaces employed to melt blister-steel; or the furnace may have tuyeres around the lower part, and he urged by a blast. He places the crucibles on a stand which has a hole through it; the crucible has also an opening in its lower part, so that the cemented metallic mass as it fuses may flow or be tapped out, and fall into a trough or mould, while more of the materials are put in at the top, so as to render the operation continuous, like a blast-furnace, so long as the crucible lasts. The preliminary process of deoxidising the ores in retorts or chests may be omitted if the melting crucibles are made sufficiently high, or have rings of fire-clay built up upon them to increase their height, so that the crude materials may be put in at the top and become gradually deoxidised as they sink down, or the material may be formed into masses by pressure in suitable moulds previous to the deoxidising or smelting process. The metallic alloy so made may be heated or melted in other crucibles when required for use. From 30 to 50 lbs. of the alloying metal may be put into each ton of molten steel before pouring the same into moulds; but when he desires to use this alloying metal (or any other similar mixture of metals containing carbon) in the manufacture of malleable iron, or in the manufacture of very mild or soft steel, he casts the said alloying metal into thin plates, or he granulates or "shots" it, after which it is to be decarbonised, or partially decarbonised, by cementation in boxes or chambers containing oxides of iron or zinc, so that the iron present in the alloy may be converted into malleable iron, and he thus prevented from re-carburetting the malleable iron, or mild steel, into which it is put in a solid, though highly-heated, state.

It is obvious that these methods, although described only in their application of metallic oxides, and to the forming of alloys of iron and manganese, or iron and silicon may also be employed in forming alloys of iron with any other known metal capable of uniting or alloying therewith, provided that such metals are of a nature to be reduced for their oxides, acids, or salts by the action of carbon at a high temperature; Mr. Bessemer, however, desires it to be understood that he lays no claim to the production of any such alloys, nor to their employment or mixture with malleable iron or steel.

THE MINER'S COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for this mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on a substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of this work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises quite a number of chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. Metallurgical chemistry and assaying; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—(Morning Call.)

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 63 pages is devoted to metalliferous veins, and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.]

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 63 pages is devoted to metalliferous veins, and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.]

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work is the Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had of any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.]

A VALUABLE WORK FOR THE MINER.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and usefulness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's treasured its hidden treasures.—[Union Temperance Journal.]

Mining Companies and Associations.

Office Dora Padre Gold and Silver Mining Company, 215 Front street, San Francisco, September 25, 1861.—Notice is hereby given that an assessment of one dollar per share on the capital stock of this company was levied this day to be paid in installments at the office of the company as follows: Twenty-five cents per share, on or before the 25th inst.; twenty-five cents per share on or before the 25th October proximo, and fifty cents per share on or before the 25th of Nov., 1861.

Shareholders will take notice that delinquent stock will be proceeded against in strict conformity to law.

By order of the Board of Trustees.
JOS. P. NOURSE, Sec'y.

Office St. Louis Gold and Silver Mining Company.—Notice is hereby given that the Board of Trustees of the St. Louis Gold and Silver Mining Company have, this 15th day of October, 1861, levied an assessment (for completing their mill) of two dollars upon each share of the capital stock of said company, payable to the Secretary, at No. 40, Montgomery Block, San Francisco.

By order of the Board of Trustees.
J. H. BREWER, Secretary.

Office of the Cole Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cole Silver Mining Company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.
J. B. COFFIN, Sec'y.

Office Dora Padre Gold and Silver Mining Company, 215 Front street, San Francisco, October 25th, 1861.—A meeting of the stockholders of the Dora Padre Gold and Silver Mining Company, held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees.
JOEL F. LIGHTNER, Secretary.

Office Gould & Curry Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the 15th day of December next.

JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one-half of which he made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HIGGINS, Secretary.

Office Crown Point Gold and Silver Mining Company, 221 Front st., San Francisco, Oct. 25th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

Office Norman Silver Mining Company.—Notice is hereby given to all stockholders in the Norman Silver Mining Company, that an assessment of fifty cents upon each share of the capital stock of said company was duly levied on the 5th day of November, 1861, and is payable on or before the 10th day of December, 1861, to Chas. Ludington, at Virginia City, N. T., or to the Secretary of the company, at No. 40 Montgomery Block, San Francisco.

By order of Board of Trustees.
J. H. BREWER, Sec'y.

Office Crown Point Gold and Silver Mining Company, 221 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining Company has this day been levied, payable on or before the 10th of December next, at the office, as above.

J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining Company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 28th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City; or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.

All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOS. S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty sixty or ninety days from date, to the Treasurer of the company.

By order of the Board of Trustees.
JOS. S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees.
HENRY S. HUDSON, Sec'y.

San Francisco, Nov. 8, 1861.

Office Chollar Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the stockholders of this company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

W. E. DEAN,
Sec'y Chollar S. M. Co.

A meeting of the shareholders of the Summit company will be held at the gold mill bakery, in Gold Hill, on Friday, Nov. 15th, at 7 o'clock P. M. Punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.

JOHN DOHLE.

Office Bullion Gold and Silver Mining Company, Van Horn District, 305 Montgomery street, San Francisco.—Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock P. M.

T. L. BIBBINS, Sec'y.

SAVAGE Gold and Silver Mining Company. A meeting of the stockholders in the above company will be held at 10 o'clock, A. M., the 17th day of December 1861, at the office of Leat, Sherwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Morrow at Virginia City, to A. K. Head Novella; or the undersigned before the 14th day of December next.

WM. M. LENT, President.

San Francisco, November 27, 1861.

Notice.—There will be a meeting of the Sides Gold and Silver Mining Company, on Sunday, November 17th, 1861, at 11 o'clock A. M., at the house of M. H. Bryan, Virginia City.

A punctual attendance is requested, as business of importance will come before the meeting.

WM. M. LENT, President.

SHAREHOLDERS of the Osceola Gold and Silver Mining Company are hereby notified that the meeting of the Trustees of said company in Virginia City, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to D. H. Russell, Virginia City.

Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Ludington & Russell, in Virginia City, on Saturday, the 10th day of December next, between the hours of twelve and three P. M.

J. S. WATKINS, Treasurer, Osceola G. & S. M. Co.
Virginia City, Nov. 2, 1861.

Office Ophir Silver Mining Company, San Francisco, Nov. 20th, 1861.—The Annual meeting of the stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 11 o'clock, A. M., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

JAS. W. WHITE, Sec'y

Notice is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia City, N. T., on Saturday the 23d inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

R. T. SMITH,
President Arizona Company.

Notice.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mina Rica," "Guasaba," "Fortune," "Santa Cruz," and "Nacimiento," situated near San Antonio, Lower California, Mexico.

CHAS. J. DEPRAT,
EM. LEYA,
DEPRAT, SCHWITZ & CO.,
CHAS. KRAT & CO.,
La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California.

For further particulars respecting the above named mines, inquire of

JOS. J. DEPRAT,
423 Washington street.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR: VOLUME IV.—NEW SERIES.

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80 Names can be sent in at different times and from different Post-offices Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Rooms 20 and 21, Government House, Corner of Washington and Sansome streets, San Francisco.

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco. Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc.

The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing.

A. ROMAN & CO.

Booksellers, Importers, Publishers,

507 MONTGOMERY STREET,

SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 500 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc. Etc. By Dana, A. M. Illustrated with 600 Engravings.

Elementary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lam-born.

The Discovery and Geognoey of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Disquisition on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....DEC. 14, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. SKETCHING and ELECTROTYPING designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is now associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

Suggestions to the Legislature about to Convene.

We have received a well prepared circular purporting to come from the chairman of an association recently organized in this city, for suppressing immigration of Mongolians and especially Conies. This subject has been thoroughly canvassed, and the people of this State have learned that the evil exists much to their distress. We have more than once pointed to this evil; but for the imbecile or political hacks, the proffered advice had been "tabled;" instead of passing a law that would forever have shut out these pestilential "cusses" from our golden shores. We know of no greater blessing than the expulsion of these semi-civilized barbarians from our sight: their very presence is loathsome and infectious. Should the incoming Legislature neglect to guard against the influx of these ecclesiastics, this evil will double itself tenfold from year to year, till the people will be forced to use measures which time and necessity will require, and until not a vestige is left of a single "cue" upon our thoroughfares or "Placers." The suggestions made in the circular are as follows, and are merely a repetition of what we have said on former occasions:

"We propose the passage of an act providing for a gradually increasing license tax upon all Mongolians in this State, engaged in mining, mechanical or other industrial pursuits, holding the employer, as well as the Mongolian, responsible for its payment, and making the process of collec-

tion summary as in the case of poll tax and miner's license.

We propose that this tax shall at first be quite insignificant, but increasing gradually until it shall amount to a prohibition of Chinese labor in California; or, at least, to a rate that will render white labor, in every branch of industrial business, more profitable than that of Asiatics. By this means it is believed that the immigration of Chinese can be effectually discouraged, and that those already here will be induced to leave our shores. This plan may possibly ultimately involve the necessity of the State making the provision for enabling the few who remain here to earn, under suitable regulations and restrictions, a sum sufficient to pay their passage to China. And it is also possible that a few of the infirm may have to be transported at the expense of the Government. But at any cost, it is good policy to speedily relieve our State of the masses of its Chinese population.

A statute of this kind would not interfere with the right of the Chinese to conduct mercantile business, and hence they would here enjoy all the real privileges which, under treaties, we enjoy in China. The rigid enforcement of existing laws, with slight modifications, will enable us to banish from our midst the loathsome Chinese brothels which are a disgrace to our State.

In addition to the enactment of a law embracing the foregoing provisions, we recommend the formation of Anti-Coolie Associations throughout the State, for the purpose of securing unity of action in enforcing laws unfavorable to Chinese immigration, and exerting an influence as citizens against the encroachments of Chinese labor.

Attention is invited to the further objects of the Anti-Coolie Association, as set forth in the constitution of that society, which provides that its members shall not encourage, patronize or deal with Chinese to the injury of free white labor, and that they shall withhold their patronage from any person who gives employment to Chinese.

All, throughout California, who are interested in restricting the further advances of Chinese labor associations, in order to relieve our State from the present and prospective evils which are the inseparable accompaniments of the presence of Chinese. Without prompt and decided effort this already serious evil will inevitably continue to increase with accelerating rapidity. Let all who have at heart the interest and honor of this young State lend their influence and aid to the accomplishment of this work. Let candor, unity of purpose and thoroughness of deliberation pervade our councils: let fixedness of aim and persistent energy characterize our action, and success will crown our efforts to eradicate this degrading element of society, which constitutes a great moral, physical and civil nuisance; and let us ever strive to consecrate this Heaven-favored land, to free, intelligent, honorable labor, and a pure civilization.

For full information in regard to the organization of Anti-Coolie Associations, address

J. W. SHAEFFER,

Chairman of the Executive Com. of the Anti-Coolie Association of San Francisco.

Newly Discovered Mines.

Nearly the whole length of the East fork of Walker river is found to be rich in mineral. Near its head at Big Meadows are situated the Dog Town and Virginia creek mines, placer diggings of coarse gold of good quality. The gold is found on a bed of lava. Experienced miners think that if the lava could be penetrated immense riches would be found. Their belief is based on the fact that a granite formation makes its appearance six miles further south, at the Mono-ville diggings, where gold is found in greater abundance.

Big Meadows is a beautiful valley about five miles in width by ten in length, along the river. The land in this valley has all been located for ranches, and in view of the high price of hay at Aurora, we judge a good hay ranch at this point valuable.

For a distance of twelve miles from the foot of the meadows the river has cut its winding bed through a broad ridge of volcanic hills, and is a perfect torrent, affording immense water power. Here ultimately will be established mills for crushing the immense quantities of rich rock found at Esmeralda. Already has a railroad charter been obtained from the Nevada Legislature, for a road from Aurora to Big Meadows; the distance is twenty miles over a feasible route.

Now we come to the Elbow Ranch district quartz mines, containing silver and gold, but nothing very rich. Two miles lower down brings us to the mouth of Bodea creek, a stream that flows past Aurora at a distance of one mile, and where already a number of steam mills are in course of erection. The mouth of this creek is fourteen miles in a northerly direction from Aurora, and strikes the river at the point nearest to Aurora. At this place water power is held at enormous figures, it being thought the Esmeralda rock must ultimately be brought here to be crushed. A railroad charter has been obtained for a road from Aurora to the river at this point, with privilege of extending ten miles up and down the river.

Four miles lower we strike Cornell District—quartz stratifications—quite rich in gold, but narrow: good wages, however, are realized from the crushing of the rock in arrastras.

Eighteen miles further brings us to the newly discovered Walker River District, where the quartz veins are larger than at Cornells and prospect good in gold and silver. Samples of coal have also been found at this point; what other rich discoveries may yet be made of course the future only will reveal. The whole extent of the river is rich beyond doubt, but Washoe and Esmeralda having been discovered earlier has kept attention from being attracted to these later but perhaps equally rich mineral fields.

"A Rolling Stone gathers no Moss."

The old saying that "a rolling stone gathers no moss," we from experience know to be true. Sad experience has taught persons younger in years than we are the truth of the maxim; but alas! what is one lesson of sad experience, yea a dozen lessons, in this fast age of ours? Another equally true saying that "a burnt child dreads the fire," seems to be exploded in our day.

We are led to these remarks by the restlessness and wandering propensities continually displayed by the mining population of California. An unhealthy desire to amass a fortune in a year, has ruined many a man in this State. A marvellous story of fabulous riches hidden near the North Pole is caught up with avidity, just the same as we listened to early told tales of riches at Gold Lake, Gold Bluff, Kern River, Frazer River, &c. Our desires run away with our reason and better judgement; we are bereft of common prudence and another disappointment awaits us.

We all remember former excitement and how one after another exploded and died away; and have too suffered from former excitements already forgotten their disappointments? Will they again and again be entrapped?

Man is endowed with reason and judgement for some good purpose, and how much better for us all, did we but exercise it oftener when our own welfare is at stake.

The miner who is continually on the move seldom amasses riches. This of course holds equally good with other classes in fact all classes of men, but as we are more particularly indicting this article for the benefit of our particular friend the "hard working miner," we will stick to our text.

Would that but every person who has heard the marvellous stories of Cariboo and Salmon river, and who has a lingering desire to go there the coming spring, would ask himself, will it pay? is it prudent? will it really benefit me? let all remember the distance from civilization, the shortness of the working season, and the small extent of country as yet prospected and reported rich. Let every one exercise reason and good judgement, and if the answers to the questions are in the affirmative, why then go. But remember the maxim at the head of this article is true now and eternally.

Junietta Quartz Lode.

This lode, situated on Martinez Hill, Esmeralda, although only discovered and located during the early part of the past summer, bids fair to rival the far famed Gold Hill Lode. The claim is six hundred feet in extent, and is owned by Capt. J. Hawkins and Thos. Wright. We have it from good authority that the handsome sum of \$16,000 was refused by Capt. Hawkins for his interest in the same.

Gold has been discovered in considerable quantities in the province of Otago New Zealand. Sailors were deserting the ships, the value of labor had increased, and there was even appearance of all public works being stopped.

PATENT LAW AMENDMENT OF 1861.

How to Obtain Patents Under the New Law.

The Patent Law Amendment Act, passed March 4th, 1861, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for patent to the Government, embracing a petition, specification, model, drawings, and the payment of the prescribed official fee. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

PRELIMINARY EXAMINATIONS.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search, made at the U. S. Patent Office, Washington, through the medium of our house in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enabled to modify his claims and expectations accordingly. Many other obvious advantages attend the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his, and used for the same purpose has ever been patented or not in this country.

Parties desiring the Preliminary Examination are requested to remit the fee (\$10), and furnish us with a sketch and description of the invention.

CAVEATS.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for this service varies from fifteen to twenty dollars. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftentimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

EXPENSE OF APPLYING FOR A PATENT, REJECTIONS, ETC.,

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that

discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is generally thirty dollars; but the charge is higher if unusual labor is involved. If the patent is granted no further agency expenses ensue. If the application is rejected we cause a thorough investigation to be made into the reasons presented by the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

No charge whatever will be made unless we succeed in procuring the grants of Letters Patent.

GENERAL REMARKS.—For the information of applicants, we would state that some agents are in the habit of charging for the preparation of the case, and having no further facilities, decline all investigation or prosecution when rejected. Others, also, having no facilities of their own, advise their clients to go to the expense of procuring official copies of the drawings and specifications of all the references. Again, others are in the habit of charging a high price at the outset, in which they include the cost of prosecuting the case, if by them deemed necessary. Under this system, if the patent issues, or is justly rejected, no further prosecution is needed, but the inventor has paid full price for a service not wanted and never rendered.

Our object in making the above statement is, not to reflect upon the manner in which other agents conduct their affairs, but simply to have our own method of doing business clearly understood.

The system adopted by us works well, gives general satisfaction, and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in hundreds of such cases. Our terms for such cases are very moderate.

MODELS, REMITTANCES, ETC.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

Where the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely, J. Silversmith, Government House, Rooms 20 and 21, San Francisco. Prepay the expense, and send express receipt to us by mail.

Simultaneously with the model, the inventor should also send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco payable to our order. Always send a letter with the model, and also with the remittance, stating the name and address of the sender. We sometimes receive envelopes containing money, but without any name or explanation; models are also frequently sent us from equally unknown sources.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the reception of model and Government fee, the case is duly registered upon our books, and the application proceeds with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature, and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last installment of the Government fee, namely twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless the invention is one of great complication; the business can as well be done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself, must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

RETURN OF MODELS.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies also to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

DESIGNS, TRADE MARKS, LABELS, ETC.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving, or stamping upon silks, calicoes, carpets, oil cloth, prints, paper hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relief, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc. The terms for which these patents are granted varies according to the fee paid by the applicant, as follows:

Patent for 3 1/2 years.....	\$10
" 7 "	15
" 14 "	30

No models are required. But duplicate drawings must be furnished, together with the usual specification, petition and affidavits, which, to render the patent of value, should be prepared with the utmost care.

Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

INFRINGEMENTS.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest or prohibition from the employment of his machinery, shop, works, factory, and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable, either collectively or individually.

Having access to all the patents, models, public records, drawings, and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Address all letters of inquiry to J. Silversmith, Government House, rooms 20 & 21, San Francisco.

APPEALS.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the district of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the appellant to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal, and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services can be retained on moderate terms.

INTERFERENCE.

If an inventor happens to apply for a patent, when another application for a similar device is pending at the Patent Office, the two cases are declared by the Commissioner to interfere, and each party is notified to present evidence as to the date when he first invented the thing. He who proves the priority of the invention receives the patent, and the other applicant is rejected.

Even after the patent has been granted, another inventor may come forward and apply for a patent for the same device; and if he can prove priority of invention the Commissioner will issue a patent to him.

The taking of evidence in interference cases is a sort of private inquest. It is not necessarily a Court proceeding. Subpoena can be issued and compulsory process employed to cause the parties to testify.

The management of interference is one of the most important in connection with Patent Office business.

Our terms for attention to interferences are moderate, and dependent upon the time required. Address all letters to J. Silversmith, Government House, San Francisco.

[Continued on page 8.]

PACIFIC PATENT AGENCY,

J. SILVERSMITH, Solicitor, Government House, San Francisco.

NEW PATENT LAW.

AN Act in addition to an "An Act to promote the progress of the useful arts."

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the Commissioner of Patents may establish rules for taking affidavits and depositions required in cases pending in the Patent Office, and such affidavits and depositions may be taken before any justice of the peace or other officer authorized by law to take depositions to be used in the courts of the United States, or in the State courts of any State where such officer shall preside; and in any contested case pending in the Patent Office it shall be lawful for the clerk of any court of the United States for any district or territory, and he is hereby required, upon the application of any party to such contested case, or the agent or attorney of such party to issue for any witnesses residing or being within the said district or territory, commanding such witnesses to appear and testify before any justice of the peace, or other officer as aforesaid, residing within the said district or territory, at any time and place in the subpoena to be stated; and if any witness after being duly served with such subpoena shall refuse or neglect to appear, or, after appearing shall refuse to testify (not being privileged from giving testimony), such refusal or neglect being proved to the satisfaction of any Judge of the court whose clerk shall have issued such subpoena, said Judge may thereupon proceed to enforce obedience to the process, or to punish the disobedience in like manner as any court of the United States may do in case of disobedience to process of *subpoena ad testificandum* issued by such court; and witnesses in such cases shall be allowed the same compensation as is allowed to witnesses attending the court of the United States; provided that no witness shall be required to attend more than forty miles from the place where the subpoena shall be served upon him to give a deposition under this law; provided, also that no witness shall be deemed guilty of contempt for refusing to disclose any secret invention made or owned by him; and provided, further, that no witness shall be deemed guilty of contempt for disobeying any subpoena directed to him by virtue of this act, unless his fees for going to, returning from, and one day's attendance at the place of examination, shall be paid or tendered to him at the time of the service of the subpoena.

Sec. 2. And be it further enacted, that for the purpose of securing greater uniformity of action in the grant and refusal of letters patent, there shall be appointed by the President, by, and with the advice and consent of the Senate, three examiners-in-chief, at an annual salary of three thousand dollars each, to be composed of persons of competent legal knowledge and scientific ability, whose duty it shall be, on the written petition of the applicant for that purpose being filed, to revise and determine upon the validity of decisions made by examiners when adverse to the grant of the letters patent; and also to revise and determine in like manner upon the validity of the decisions of examiners in interference cases, and when required by the Commissioner in applications for the extension of patents, and to perform such other duties as may be assigned to them by the Commissioner; that from their decisions appeals may be taken to the Commissioner of Patents in person, upon payment of the fee hereinafter prescribed; that the examiners-in-chief shall be governed in their action by the rules to be prescribed by the Commissioner of Patents.

Sec. 3. And be it further enacted that no appeal shall be allowed to the examiners-in-chief from the decisions of the primary examiners, except in interference cases, until after the application shall have been twice rejected; and the second examination of the application by the primary examiner, shall not be had until the applicant, in view of the references given on the first rejection, shall have renewed the oath of invention, as provided for in the seventh section of the act entitled "An act to promote the progress of the useful arts, and to repeal all acts and parts of acts heretofore made for that purpose," approved July 4th, 1836.

Sec. 4. And be it further enacted that the salary of the Commissioner of Patents, from and after the passage of this act, shall be four thousand five hundred dollars per annum, and the salary of the chief clerk of the Patent Office shall be two thousand five hundred dollars, and the salary of the librarian of the Patent Office shall be eighteen hundred dollars.

Sec. 5. Be it further enacted, that the Commissioner of Patents is authorized to restore to the respective applicants, or, when not removed by them, to otherwise dispose of such of the models belonging to rejected applications as he shall not think it necessary to be preserved. The same authority is also given in relation to all models accompanying applications for designs. He

is further authorized to dispense in future with models of designs when the design can be sufficiently represented by a drawing.

Sec. 6. And be it further enacted, that the tenth section of the act approved the 3rd of March, 1837, authorizing the appointment of agents for the transportation of models and specimens to the patent office, is hereby repealed.

Sec. 7. And be it further enacted, that the Commissioner is further authorized, from time to time, to appoint, in the manner already provided for by law, such an additional number of principal examiners, first assistant examiners, and second assistant examiners, as may be required to transact the current business of the office with dispatch, provided the whole number of additional examiners shall not exceed four of each class, and that the total annual expenses of the patent office shall not exceed the annual receipts.

Sec. 8. And be it further enacted, that the Commissioner may require all papers filed in the patent office, if not correctly, legibly, and clearly written, to be printed at the cost of the parties filing such papers; and for gross misconduct he may refuse to recognize any person as patent agent, either generally or in any particular case; but the reasons of the Commissioner for such refusal shall be duly recorded, and subject to the approval of the President of the United States.

Sec. 9. And be it further enacted, that no money paid as a fee on any application for a patent after the passage of this act shall be withdrawn or refunded, nor shall the fee paid on filing a caveat be considered as part of the sum required to be paid on filing a subsequent application for a patent for the same invention.

That the three months' notice given to any caveator, in pursuance of the requirements of the twelve section of the act of July 4th, 1836, shall be computed from the day on which such notice is deposited in the post office at Washington, with the regular time for the transmission of the same added thereto, which time shall be endorsed on the notice; and that so much of the thirteenth section of the act of Congress, approved July 4th, 1836, as authorizes the annexing to letters patent of the description and specification of additional improvements, is hereby repealed, and in all cases where additional improvements would now be admissible independent patents, must be applied for.

Sec. 10. And be it further enacted, that all laws now in force fixing the rates of the Patent Office fees to be paid and discriminating between the inhabitants of the United States, are hereby repealed, and in their stead the following rates are established:

On filing each caveat, ten dollars.

On filing each original application for a patent except for a design, fifteen dollars.

On issuing each original patent, twenty dollars.

On every appeal to the examiners-in-chief to the Commissioner, twenty dollars.

On every application for the re-issue of a patent, thirty dollars.

On every application for the extension of a patent, fifty dollars; fifty dollars in addition, on the granting of every extension.

On filing each disclaimer, ten dollars.

For certified copies of patents and other papers, ten cents for one hundred words.

For recording every assignment, agreement, power of attorney, and other papers, of three hundred words or under, one dollar.

For recording every assignment and other papers over three hundred and under one thousand words, two dollars.

For recording every assignment or other writing, if over one thousand words, three dollars.

For copies of drawings, the reasonable cost of making the same.

Sec. 11. And be it further enacted, that any citizen or citizens, or alien or aliens, having resided one year in the United States, and taken the oath of his or her intention to become a citizen or citizens, who, by his, or her, or their own industry, genius, efforts or expense, may have invented or produced any new or original design for manufacture, whether of metal or other material or materials, and original design for a bust, statue or bass relief, or composition in the basso-relievo, or any new and original impression or ornament, or to be placed on any article of manufacture, the same being formed in marble or other material, or any new or useful pattern, or print, or picture, to be either worked into or worked on, or printed, or painted, or cast, or otherwise fixed on any ar-

ticle of manufacture, or any new and original shape or configuration of any article of manufacture, not known or used by others before his, her, or their invention or production thereof, and prior to the time of his, her, or their application for a patent therefore and who shall desire to obtain an exclusive property or right therein to make, use and sell, and vend the same, or copies of the same to others, by them to be made, used and sold, may make application in writing to the Commissioner of Patents expressing such desire; and the Commissioner, on due proceedings had, may grant a patent therefor, as in the case now of application for a patent, for the term of three and a half years, or the term of seven years, or the term of fourteen years, as the said applicant may elect in the term of his application, provided that the fee to be paid in such application shall be for the term of three years and six months, ten dollars; for seven years, fifteen dollars; and for fourteen years thirty dollars; and provided that the patentees of designs under this act shall be entitled to the extension of their respective patents for the term of seven years from the day on which said patents shall expire, upon the same terms and restrictions as are now provided for the extension of letters patent.

Sec. 12. And be it further enacted that all applications for patents shall be completed and prepared for examination within two years after filing the petition, and in default thereof they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable; and all applications now pending shall be treated as if filed after the passage of this act; and all applications for the extension of patents shall be filed at least ninety days before the expiration thereof, and notice of the day set for the hearing of the case shall be published as now required by law, for at least sixty days.

Sec. 13. And be it further enacted, that in all cases where an article is made or vended by any person under the protection of letters patent, it shall be the duty of such person to give sufficient notice to the public that said article is so patented, either by fixing thereon patented, together with the day and year the patent was granted, or when, from the character of the article patented, that may be impracticable, by enveloping one or more of said articles, and affixing a label on the package or otherwise attaching thereto a label, on which the notice with the date is printed; on failure of which, in any suit for the infringement of letters patent by the party failing so to mark the article, the right to which is infringed upon, no damage shall be recovered by the plaintiff except on proof that the defendant was duly notified of the infringement, and continued after such notice to make or vend the article patented. And the sixth section of the act entitled "An act in addition to an act to promote the progress of the useful arts," and so forth, approved the 29th day of August 1842, be and the same is hereby repealed.

Sec. 14. And be it further enacted, that the Commissioner of Patents be and he is hereby authorized to print, or in his discretion to cause to be printed, ten copies of the description and claims of all patents which may hereafter be granted, and ten copies of the drawings of the drawings of the same, when drawings shall accompany the patents; provided the cost of printing the text of said descriptions and claims shall not exceed, exclusive of stationary, the sum of two cents per hundred words for each of said copies, and the cost of the drawing shall not exceed fifty cents a copy; one copy of the above number shall be printed on parchment, to be affixed to the letters patent; the work shall be under the direction and subject to the approval of the Commissioner of Patents, and the expense of the said copies shall be paid for out of the patent fund.

Sec. 15. And be it further enacted, that printed copies of the letters patent of the United States, with the seal of the Patent Office attached thereto, and certified and signed by the Commissioner of Patent shall be legal evidence of the contents of said letters patent in all cases.

Sec. 16. And be it further enacted, that all patents hereafter granted shall remain in force for the term of seventeen years from the date of issue; and all extensions of such patents is hereby prohibited.

Sec. 17. And be it further enacted, that all acts and parts of acts heretofore passed which are inconsistent with the provisions of this act be and the same are hereby repealed.

Approved March 21, 1861.

SUMMARY OF MINING NEWS.

To Miners and Mill Owners.

We respectfully request all persons interested in the Mines, Quartz Mills, or in any prospecting expedition; also the owners of the different mining districts to forward to us all times, such information concerning the condition etc., of the mines and hills in their vicinity, and description of localities, as they may think will prove interesting or useful to the public for publication. Records of mining districts all obligate by sending us their address.

CALIFORNIA.

Tulare county.

A claim of Gordon's Gulch may not appear familiar to your eye, and it is not as yet to be found on the map, permit me to inform you that it is a mining camp lately started on Gordon's Gulch, the most central point of the White River mining region, and named Sebastopol, Gordon's Gulch, on the fact that an old resident squatter here was one of the heroes who fought and died at the battles of Inkerian, Tisklavla and Alma. This new like San Francisco had to make a commencement, although I think it is never as large, as there is not as much loose ground here to build on, nor can it get a corner lot for money, and a person might build on the Court house block where it is not for some old aristocrat in the middle of it. Mr. J. Edgar, late of Visalia, has already a store here; the Roman is well fortified and several fell in the first attack, though none were mortally wounded, as miners on Gordon's Gulch are making a living, and some of them are doing well. The claims are very wide and the pay dirt on the ledge varies from a few hundred feet in width, then below Sebastopol, have run a drift on the ledge over fifty feet, and their dirt sometimes pays three dollars to the ton. This claim is supposed to be rich and extensive. H. Wylle (H.M.C.) company has been doing well. The old here himself, when his day's work is over, delights to teach to a few select pupils the manly and noble art of digging on your feet. Mr. Higgins, late of Visalia, has been working about mile below Sebastopol, and their dirt has been paying them from fifty cents to a dollar a sack. Many others are working on the gulch with varied success. The gulch from head to mouth is twelve miles long, and rich spots have been found on it in places the entire length. There are also on it a ledge, which have not been prospected. Lane & Butler washed two pans of dirt on this gulch which contained one hundred and forty dollars, and there are some of the same kind of dirt left. A great drawback in these mines is the lack of water and the deep stripping. There are now about forty miners about here, and more coming. A. J. Mally and Dr. Hoge are doing out very rich quartz.—Delta.

Sierra county.—On Saturday night last, says the Sierra Citizen, 2135 tons, or about one hundred and forty pounds of gold dust were brought in from Leis' at the Sierra Butte, being thirty-seven thousand dollars for forty-four days run. The dividends for 1861 ending with the last clean up, one hundred and fifty-four thousand dollars, clear of all expenses, which included the building of a new mill. The monthly expenses average a little over four thousand dollars a month. It is quite a remarkable fact that one of the quartz enterprises in this county have failed, not a mill but at least paid expenses and wages, or interest money. It is equally a matter of remark that the old hands of thousands of dollars have been every one expended in prospecting tunnels, which in a great majority of cases are total failures, so very few of the many quartz leads in the district were tested. The drifters have had a glorious season for washing up or dirt. We have heard that several parties commenced hydraulic, but have heard of no results. We expected to have been able to report a yield from various tunnel companies. The Spanish Flat company, three on, has with one hundred and twenty days work, in all cleaned up six hundred dollars. This was the dirt taken out in running the main tunnel at the amount more than doubled the expectations of the proprietors. The dollars to the man for one hundred and twenty days is not a bad surprise for the hard fisted miners. At Newark the North American boys gleed off a pile of refuse dirt and bed rock, merely for the purpose of removing it out of the way, and unexpectedly cleaned up thirty ounces. All the companies in the neighboring precincts are washing up with encouraging prospects.

Placer County.—Encouraging accounts reach us from this county. The Dutch Flat Enquirer makes the following comments upon its mining progress in Placer Co.: Since the rains have set in, our miners have been generally busy in rigging their machinery for the winter's washing. We have all are ready now to commence operations in earnest. By the kindness of Mr. Brown of the American company, whose claim is situated just above Leavenworth, we are now engaged in running the main tunnel and cleaned up on Saturday last, realizing the handsome sum of sixteen hundred and thirty-seven dollars. It is proper, we presume to state, that this company is not dependent upon either of the water ditches for their water. Notwithstanding the great amount of water fallen the past two weeks, the ditches have not as yet a sufficiency to supply all who are in need of that very necessary element. This, however, will not be the case long, as one of the water companies have made a great enlargement of its ditches, and the other made such improvements in reservoirs, ditches, &c. as will enable them in a short time to supply all. In this connection we will take occasion to say that hereafter we intend visiting our miners once a week, and will be under obligations to them if they will render us the trifling service in telling us such things as will be interesting to our people generally.

Mariposa county.—The Mariposa Gazette furnishes us with the following: The successful working of the quartz veins in the neighborhood of Princeton has developed quite a town in that locality, where by a year ago no single-barreled grocery existed. Stores, saloons, livery stables and private residences have sprung up as if by magic. They are temporary structures, however, and so huddled together, and of such inflammable material, that one small addition of fire would wipe it out. The erection of two new quartz mills is in contemplation—also a store, by Park & Co., who, it is reported, intend making that the headquarters of mining operations on the grant now as "Las Mariposas."

After the late rains some Mexicans went out prospecting, and found near Tornitas, in two days, five hundred dollars in quartz gold. So soon as more showers fall, there is every probability of much more being found. A correspondent on the Upper Merced, informs us that the late rains have had a stop to mining on the river. The season has been an unusually long one, and all the claims between Bidley's Ferry and Johnson's dam, have dried, except the deep hole claim, opposite Gate's House. \$3,412 was divided by one company, and others have done equally well. This portion of the river has generally paid when worked properly.

Plumas county.—The Plumas Standard says: We learn from Wm. Frink that times are quite lively in and about Round Valley. He reports about fifty men there prospecting and mining. Tate and Jenkins are erecting a steam quartz mill, which they expect to have in running order in the course of two months. When completed it is expected this mill will be one of the finest in the State. Kuisely & Co. intend putting up a mill also, early in the Spring. We have rumors also of Washoe machinery being moved into the Valley in the spring, and erecting it on one of the rich ledges which abound in that vicinity.

Nevada county.—The North San Juan Press says that a successful blast was put off in the Knickerbocker claims at that place, last week. The fuse at first burnt within six feet of the powder—one hundred and odd eggs, and then went out. After much difficulty men were persuaded to go in to the chambers underground, where the charge was placed, and put in a new fuse, which was successful, the earth being thrown up like an earthquake by the discharge.

Sacramento county.—There is a tunnel claim about Folsom that is owned by two persons, that has paid each four hundred dollars a week for the last twelve months.

Los Angeles county.—The Los Angeles Star understands the miners are gathering in again to these mines, and that there are as many men engaged there now as at any former time. The work on the side hills will be carried on vigorously during the winter.

HUMBOLDT DISTRICT.

A new discovery of coal, rivaling in quality and quantity that of the Whitman claim, has been lately struck about one and quarter miles north-east of Dayton. The vein ranges in width from three to twelve feet, and thirteen quarter sections have been located. Should it prove as extensive as supposed, we can congratulate our fellow citizens on having so near us that great desideratum of the Territory—fuel. The specimen seen by us selected but taken promiscuously from the vein—some of the pieces weighing as high as ninety pounds. Mr. Hurst informs us that Captain Hall, of the Ophir works, offered \$20,000 for 1,000 tons of quartz to be taken at the ledges; and Mr. Lamoreaux offered fifty dollars a ton for fifty tons of assorted rock, to be taken at the place. Two tons will shortly be shipped to this city to be worked by the Veatch process, and our citizens will have an opportunity of witnessing the result. These two claims are owned by the same parties and are located in several different places. The company have made arrangements with Mr. George Veatch of Petrolina, to build a mill at their claims, to be completed by the first of April, who contracts to crush twenty-four tons a day, for one year, at fifty dollars a ton. They think they can easily supply three or four mills with rock. The veins are situated in Star Canon, Star District. There is sufficient water-power in the Canon to carry on a great number of mills, and forty sites have already been located. When water was at the lowest mark, Sept. there were one hundred and forty inches in the canon, and in ordinary times much larger. The water in the mills are already contracted for in Star Canon, and two in Buena Vista District. Mr. Hurst reports that whole section of the country to be in a flourishing state. The entire population he thinks cannot be fewer than eight hundred souls, of which three hundred are in Star Canon. At that place there are fifty-seven houses—stone, adobe and tent—and three stores. Seven families reside there. Provisions are not very high. Flour can be had for fourteen dollars per hundred, bacon thirty dollars per hundred, and other things in proportion. Great quantities of provisions have been shipped there from Red Bluff and Marysville. There is considerable rivalry between the two routes leading from the places mentioned. The road from Marysville comes through the Truckee pass, and that from Red Bluff comes through Honey Lake Valley. It is thought the latter will be the best, especially as a cut-off is being built between Honey Lake and Red Bluff which will shorten the distance some eighty miles. There is no doubt in Mr. Hurst's mind that the Humboldt mines are very rich, and that which is fully developed will equal, if not surpass themselves in this section. The silver predominates in the form of a chloride, and Dr. Brighton, a competent chemist, who resides in the district, has obtained assays as high as \$3,000 per ton. In addition to the mill sites above noted as having been located in Star Canon, forty more have been taken up on St. Mary's creek, and about 25 in Buena Vista District.

NEVADA TERRITORY.

The news from Washoe with reference to mining interests are limited. The Territorial Enterprise speaks of the Gould & Curry mills as follows:

We recently visited the mill of the Gould & Curry Company, situated at the junction of Six and Seven Mile Canons, and through the courtesy of the gentlemanly and energetic manager, we were enabled to obtain an interesting description of that splendid structure. The mill is situated about two and a half miles east from this city, on a flat containing some sixty acres. The houses built and occupied by the officers and employees of the work, present the appearance of a small village. The mill itself, however, is the grand feature, standing forth a monument of human skill and industry. It is the largest in the Territory, and from the known character of the claim, it will doubtless take the rank of the first in this country. It is built in the form of a cross, the main building being two hundred and fifty feet in extent, and the two wings, seventy-five feet each. The machinery and batteries are from the Pacific Foundry, San Francisco, and are considered superior specimens of workmanship. The engine is fifty horse power, and the steaming apparatus consists of six furnaces and three boilers twenty-six feet long and forty-two inches in diameter. The building is divided into three compartments. The amalgamating department consists of five vats, each eighty-seven and a half feet deep by fifty feet wide. The Veatch process will be used. The centre of the building is occupied by the battery department. It is one hundred and twenty-five in length by fifty in width, and contains eight batteries of five stamps each, capable of crushing forty tons of ore per day. The third department is that of the engine-room, and occupies the same space as the amalgamating department. The mill will employ thirty men constantly; and as it is the intention of the Company to have the capacity doubled as soon as convenient, a force of sixty men will be employed night and day. The ore-house and drying department is one hundred feet in length by fifty-eight feet in width, and is situated to the west of the mill. A principal feature is the small amount of labor required to keep the mill in operation, the ore being dumped at the entrance and so arranged as to constantly feed the stamps. The mill has the largest capacity, and does the greatest amount of work with the least force of any quartz mill in the Territory. The water is taken from a large natural spring in which the water used at the mill is converted into practical use. It is conducted on the south side by means of a ditch and flume one thousand feet in length, and on the north side in Six Mile Canon, an immense reservoir is built, by which the water is made to run directly through the amalgamating department and thence into the canon again. Nature itself appears to have prepared the site for its present use. Everything is constructed in the most substantial and workmanlike manner, and we have seldom seen a finer mechanical structure. The arroyo running from the mouth of the Sides tunnel presents the appearance of a fine mountain stream, but the amount of water issuing from the tunnel has greatly decreased. When we saw it last, yesterday, we should judge there was not over fifty inches of water running, but this may be counted upon as a constant stream.

Route and Distance to the Nez Perces Mines.

From San Francisco to the Dalles via Portland, distance: thence to Walla Walla by water one hundred and eighty-five miles; thence to Lewiston by land ninety miles; from Lewiston to Oro Fino, one hundred and ten miles; from Lewiston to Elk city, eighty-five miles; from Lewiston to Salmon diggings, one hundred and forty miles; from Lewiston to either of the mining localities the journey is by land. The Cariboo country is situated six hundred miles north from the Nez Perces mines. It is said that a road is opened from the Dalles to the latter mines, but only passable as yet for foot men and pack animals.

MEXICO.

The following is an extract of a letter received by a gentleman in this city from Sonora:

Ures, Nov. 12, 1861.

Since my arrival at the mine I have been engaged in making adobes, using them instead of fire bricks for the furnace, the "ladillos" which I purchased in San Francisco having melted two inches during a fire of sixteen

hours. The adobes serve to answer the purpose in this until the arrival of genuine fire bricks from Scotland.

Enclosed I send you some of the copper which I smelted: silver traces are visible. Please have it assayed and send me a copy of the certificate. I have endeavored to procure an assay at our mine here, but they have no means of parting gold from silver, much less these two metals from copper ore. By next steamer you may look for a small shipment of ore as well as amalgam metal bars. Political news is more satisfactory than it has been for some time.

On the 16th ult. the rebel chief, Chutcheoll, a Frenchman, attacked Hermosillo, with his five hundred "ladrones," but after an engagement of one hour and a half he was totally routed by Governor Pascuaria, who held the city with one hundred and fifty men, and he left all his cannon, fifteen in number, and a quantity of silver bars in the hands of the victorious little army.

The flying "Minera Comayagueros" were scattered by the winds, and reports have come in to the effect that Chutcheoll has been captured and shot at Barojeca, on the other side of Yaqui River. The Governor has gone to Alamos, to punish the abettors of this insurrection, which I believe will have been the last one, for a long time to come. Peace seems more rigorous in Sonora and the prospects offer safe investment for capital.

At Tecuipa, a vein which has been worked for copper is now paying silver, averaging twenty six ounces per cargo (300 lbs) of ore, and indications in our claim go far towards establishing a similar occurrence before the elapse of many months.

BRITISH COLUMBIA.

J. C. Beedy, formerly of La Porte, Sierra county, has returned to that place from the Cariboo mines. The Messenger says he describes the country as extremely gold and muddy. The weather is wet and stormy through the whole mining season, and very few miners can endure the exposure. On the 1st of August last snow fell to the depth of six inches. Every particle of food taken into the mines before the first of July has to be packed upon men's backs, through mire knee deep much of the way. The British laws governing the mines, require the holder to be at the diggings by the first of June, and claims are only unjumble from the first of October till the succeeding June. A large share of the business runs in this far out of the way country are from Sierra county. Beedy says no man with less than one thousand dollars should venture to Cariboo. Miners there say that if the seasons were as long, and the climate as favorable there as here, the mines would than equal those of any part of our own Sierra. But as it is they have the poor with them always: the Scriptures on that "pink," are as applicable to that section as this. Mr. Beedy has been trading very successfully since March last, and will return early in the Spring. His testimony may therefore be considered honest and reliable. . . . The Pacific Quick-silver Mining Company filed its certificate of incorporation yesterday. The purpose is to mine for quicksilver in Sonoma county. The capital stock is \$375,000, in shares of \$500 each. The first Board of Directors is composed of S. Parly, T. S. Bonest, F. D. Kohler, M. D. Barron, D. Maddox, Levi Hermance, G. H. Bell—most of whom are well known residents of this city, where the office of the company is located.

Mining Companies and Associations.

GOLD HILL TUNNEL CO.—The meeting called for Saturday, November 9th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the saloon of Webb & Coppers, Gold Hill.

A punctual attendance is requested, as business of importance will come before the meeting.

ROBERT APPLE, Sec'y.

SHAREHOLDERS of the Caledonia Gold and Silver Mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 20th inst., to the Superintendent, at his office in Gold Hill, or to WM. B. AGARD, San Francisco. Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 9th day of December next.

By order of the Board of Trustees,
Gold Hill, Nov. 4th, 1861.

POSTPONEMENT OF SALE.—The sale of mining ground, at Silver City, by the Kansas Mining company, is postponed until four o'clock, p. m., Tuesday, Nov. 19th, 1861. Sale to take place on the grounds of the company. Delinquents will please take notice and 'come to time.'

By order of the Board of Trustees,
R. C. CHAPPELL, Sec'y
Virginia city, Nov. 9th, 1861.

TODAS SANTOS COMPANY.—The members of the Todas Santos Company are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary on demand. Also that the several interests of the members, who fail to pay their said assessments, on or before the 10th day of November, instant, or so much thereof as may be necessary to pay said assessments, together with cost of advertising and sale, will be sold at Public auction to the highest bidder, on Wednesday, Nov. 20th, 1861, in front of the office of John Kelly, on B street, in Virginia.

By order of the Board of Directors,
L. W. FERRIS, Sec'y

GOLDEN CANYON COMPANY, GOLD HILL DISTRICT.—A meeting of the shareholders in the above named company will be held at the office of H. O. Gaylord, in Virginia on Saturday, Nov. 16th, at 7, p. m.

By order,
T. A. MONKHOUSE, Sec'y.

ADRIATIC CO.
POSTPONEMENT OF SALE.—Delinquent stockholders are hereby notified that the sale of delinquent stock advertised to be sold on November 10th, has been postponed until Thursday the 21st inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at 1, p. m.

By order of the Board of Trustees,
JOHN G. GILCHRIST, Sec'y.
Virginia city, November 10th, 1861.

POSTPONEMENT OF SALE.—Delinquent stockholders of the Uncle Sam company, Flowsing Mining District, are hereby notified that the sale of delinquent stock advertised to be sold on November 10th, has been postponed until Monday, the 15th inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at 1, p. m.

By order of the Trustees,
JOHN G. GILCHRIST, Sec'y.

MEMBERS of the Senator company, Congress Ledge, Devil's Cato District, are hereby notified that an assessment of twenty-five cents per foot will be levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

L. W. FERRIS, Sec'y.

Chemical Decomposition.

When compounds are resolved into their elements, or when the chemical constitution of substances is altered, they are said to be decomposed; and when, in this operation, new products are formed, such products are called the *results of decomposition*. Thus, *ammonia* is the result of the decomposition of most animal substances; *carburetted hydrogen gas* is the result of the decomposition of pit coal, &c.

Chemists use the terms *simple* and *compound*, or *single* and *double* decomposition, to distinguish between the less and more complicated cases. When a compound of two substances is decomposed by the intervention of a third, which is itself a simple, or which acts as such, the case is one of simple decomposition: water, for instance, is a compound of oxygen and hydrogen. When the metal potassium, which is a simple body, is thrown into it, it is decomposed, the hydrogen is liberated in the form of gas, and the oxygen combines with the potassium to form potassa. Such a case is often tabularly represented as follows; and the annexed numbers are the *equivalents* of the acting bodies, or the respective weights which are required for perfect decomposition.

This shows that when 9 parts by weight of water are decomposed by 40 parts of potassium, 48 parts of potassa (or oxide of potassium) are formed, and one part of hydrogen liberated.

When two new compounds are produced, the result is called *double* or *complex* decomposition. Thus, when potassa (composed of potassium and oxygen) and hydro-chloric acid (composed of hydrogen and chlorine) re-act upon each other, chloride of potassium (composed of chlorine and potassium) and water (composed of hydrogen and oxygen) are the results. These, with their respective *equivalents*, are shown in the following diagram.

Chloride of potassium 76.

This table, therefore, shows that 37 parts by weight of hydro-chloric acid and 48 of potassa produce, by mutual decomposition, 76 parts of chloride of potassium and nine of water.

A knowledge of the mutual decomposing powers of different substances, or, in other words, of their relative affinities, constitutes the skill of the practical chemist.

On the Formation of Trap Dikes.

At the meeting of the American Association, 1860, Mr. J. D. Whitney read a paper, prepared by himself and Col. Foster, on the origin and stratigraphical relations of the trappean rocks of Lake Superior. It was a minute description and discussion of the traps found in the Lake Superior region, especially about the copper mines at Keweenaw Point, and presented as many objections as possible to the theory, now pressed with much vigor, that trap is not of igneous origin.

Prof. Agassiz quite concurred with the authors of the paper, that an examination of the shores of Lake Superior fully established the igneous origin of trap. The evidence of the heated mass upon the sandstone below was as plain as that of a hot poker upon wood. He thought that if the advocates of the aqueous origin of the trap would examine some of these places, they would be convinced that they were wrong.

Prof. Wm. B. Rogers coincided in maintaining the igneous origin of trap, and adduced some instances supporting that theory.

Prof. Agassiz said that he had observed the influence of the rocks upon the dikes, as well as the influence of the dikes upon the rocks. There was a very good instance of this at Nahant, where the influence of the rock in producing a slow cooling of the horublenide was seen in the very large crystals there found.

The German scientific journals tell us that Prof. Lamont has nearly brought his researches on terrestrial currents to a close, and has arrived at most remarkable results, having succeeded in proving that electrical currents on the surface of the earth are transmitted in a definite direction, and that a perfect correspondence exists between them and the variations of the magnet. The hearings of the facts established cannot at this moment be accurately estimated, but at all events electrical and magnetical researches will be put upon a new footing by them.

HUMBOLDT MINES.—A miner in from the Humboldt states that parties are packing their dirt a mile, and making \$20 per day to the hand. He brings in choice specimens of gold bearing quartz. The Humboldt country will, the coming season, afford a fine field for prospectors, yield many a man a fortune, and become the abiding place of men, women and children, never more to be deserted, or turned over to wild beasts and wilder men.—*Silver Age.*

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage England costs about \$150.

AGENCY FOR PATENTS.—The undersigned having been established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Patents and P. also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY

Office, 410 Montgomery street,

CHARLES R. BOND, (Late City and County Assessor.)

REAL ESTATE AGENT,

410 Montgomery street, San Francisco.

REAL ESTATE PURCHASED AND SOLD, LOANS NEGOTIATED.

PACIFIC METALLURGICAL WORKS.

NORTH BEACH,

Are now prepared to reduce by contract, Gold or Silver Ores or Sulphides, at the lowest possible price, and to refine the same. Price of reducing will be as low as the gold or silver established in Europe or in the States, thereby saving freight, insurance and interest. BRAINSHAW & CO., Agents, Cor. California and San.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for 17 years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the 17 years of Mr. Hemstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$45,386 39, being some \$230,000 less than the limit, and, in fact, a loss under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is two per cent., against two per cent., wasted by our mint. The total expenditures for three years under Mr. Birdsall & Lott, amounted to the large sum of \$1,011,733 39. Under Mr. Hemstead, the total expenditures for the same years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hemstead was upward of \$100,000 in favor of the latter. Retiring from the Superintendency, Mr. Hemstead leaves an unexpended balance of appropriation due the mint of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hemstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable information must prove to the mining community of state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths. fine.....3cts per oz.
" from 300-1000ths. to 750-1000ths fine.....7cts
" " 750-1000ths to 950-1000ths ".....14cts

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths. cents. per standard ounce, $\frac{1}{2}$ per ct. value of silver for making bars; also when gold is contained, per ct. on gross value of gold for coining. Refining charges in purchases.

BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be paid for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents. per standard oz. $\frac{1}{2}$ per ct. value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$ per standard oz., and is exempted from the coinage duty unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the denomination will be entered on the gold and silver register as most congruous with the physical aspects of the material in the warrant it must be marked that so much is paid in gold and so much in silver, according to the tests reported by the assayer. The above rules, and others were promulgated on July 10th, by Superintendent R. J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1860.

On and after the 15th inst., a charge varying in amount and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general charge, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

THE FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to the extensive establishment, we can confidently announce to the public we now have
Best Foundry and Machine Shop on the Pacific Coast.

Upwards of forty five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this the Rocky Mountains.

On hand and ready for sale, High and Low Pressure Engines, Marine and Stationary; Straight Quartz Mills of all sizes and shapes; Stamp-mills and Dies of iron, which is imported by us expressly for purpose—its peculiar hardness making shoes and dies last two or three times longer than those of other mills; Flouring Mills; Tang, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per hour more perfectly than any now in use. One of these shingle machines is seen in operation at Metcalf's mill in this city.

Also Amalgamators, with the latest improvements; Howland & Hanscomb's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now

on hand. Screens, of every degree of fineness, made of the best Russia iron. Belts and Axes of all dimensions; Building Fronts; Horse Powers; Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Linn's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings, of which we can do work promptly attended to.

Useful to the public for their many past favors, we would respectfully ask a continuance of their patronage. Before purchasing, give us a call and what we can do.

GO DDALL & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hour after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, }
Barbula Mill Company, } Washoe
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson, }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to an even surface.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

DEVOE & CO.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Mann & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts., 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

Esmeralda and Bodea Mining District.

We are indebted to a friend, in whose judgement we have implicit confidence, for many items of interest from the Eastern Slope. The person referred to has been engaged during the past summer in prospecting in the Esmeralda and Bodea district for silver and gold.

He avers that the section spoken of is rich beyond precedent, in many of the most valuable minerals. The quartz ledges of Esmeralda are rich in gold and silver, the former predominant near the surface, but in sinking the silver is found gaining.

In the Bodea district the veins are generally small but very rich in gold.

Coal is also found in the latter district; is apparently abundant and of good quality. The only vein yet opened is situated eight miles west from Aurora. A vein of good coal at this point would be of incalculable value to the development of the riches hidden in the sterile mountains of that locality.

Speculations in silver mines are at an end, and we are not sorry. Quartz lodes in order to become valuable, and in order for owners to realize their worth, must be developed, and the sooner owners of quartz mines become convinced of this fact, the better for the country and all parties concerned. We advise all parties interested to at once, and for all time, banish the vain expectations of becoming rich by holding on to ledges without working them, but let every owner of a mine at once commence in good earnest to dig and delve and not cease until his lode has been thoroughly prospected, and our word for it, if the metals are there one half as abundant as claimed, capitalists will not be long in finding it out, and miners instead of being rich in the prospective, will soon become so in reality.

Important Mining Suit Decided.

Antoine, Co., Plaintiffs, } In the District Court of Yuba
vs. } County.
Ridge & Co., Defendants. }

The suit was brought for damages for trespass on a mining ground, and to settle the boundaries thereof.

The Plaintiffs claimed that their ground was located to the center of the hill by the operation of the mining laws now in force; while the defendants claim that their ground located on the other side of the hill, was located under the old law, previous to the location of the Antoine Claim.

From the verdict of the jury we conclude that the defendants failed to establish their averments. The jury found that the Antoine claim had been extended to the center of the hill, and that they had a possessory right thereto, previous to the location of the Ridge claim on the opposite side of the hill, and awarded damages in the sum of two thousand five hundred dollars.

The Holidays.

The holidays are again drawing near, bringing with it its agreeable recollections and pleasures. Californians are not unlike in their devotions and attentions to their relatives and friends from our sister States. The feasts are sumptuous, the gifts and presents gigantic, both in style and costliness. We visited a few days since the establishments of A. Kohler, as we do every now and then, to keep track of the modern improvements in manufacturing arts, music instruments and toys. We were there for nearly an hour examining these, and were not half through seeing the extent of the articles of his Bazaar. Kohler is the only extensive importer of such articles on this coast. He keeps the articles for presents, and his are the cheapest and most select.

Good Profits.

The Garibaldi company at Esmeralda had raised from their lode, by contract, four hundred and seventy tons of rock at a cost of three dollars per ton, but having no mill at their own sold the whole for \$5170, or at the rate of eleven dollars per ton. The Rio Del Monte Company—subjected to a less expense for excavating—sold five hundred tons for ten thousand dollars, or twenty dollars per ton.

Mining Agency.

We contemplate the establishing of a Mining Agency for the purchase and sale of mining ground and stocks of all kinds. Will probably do so as soon as we can make proper arrangements. Due notice will be given when we are ready to transact business.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been limited:

Potosi, \$25 per foot.
Central, \$550 per foot.
Ophir, \$850 per foot.
Gould & Curry, \$330 per foot.
Chollar, \$50 per foot.
Lucerne, \$35 per foot.
St. Louis, \$15 per foot.
Sacramento, \$25 per foot.
Yellow Jacket, \$110.
Monte Cristo, \$5.
Succor \$15.
Cole, \$30 per foot.
California, \$400 per foot.
Durgen, \$10.
Miller, \$12

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
[Having completed all the requisite arrangements we lay before our readers a reliable list of prices of mining stocks of Utah.]

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will accept the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH,
GOVERNMENT HOUSE,
SAN FRANCISCO.

N. B.—R. W. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will hereafter transact all business pertaining to patents for us, at the patent office in Washington city. For instructions and the new law regulating patents, we refer the inventor to the above.

Miners, Inventors, Agriculturalists, Capitalists, Mechanics, will find it to their advantage to subscribe to the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

UNION IRON WORKS (ESTABLISHED IN 18)

N. E. Cor. First and Mission streets, San Francisco

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the twelve years, during which time new and extensive Buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS MACHINERY AND CASTINGS,

Of every description, on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Powers, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work, Steamboat Repairing and Blacksmithing, etc.
STEAM ENGINES BUILT AND REPAIRED.

Besides the extensive assortment of Machinery Patterns, attention is called to the new and beautiful designs for Building Casings, Iron Fronts (suitable for Stores, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, Etc.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & G. M. WOODWARD'S PATENT.—This Pump is used for supplying Steam Boilers, Mills and Public Buildings, with water. In case of Fire, arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the Discharge Outlet. It is suitable both for Marine and Mining purposes, being used on nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED.
PETER DONAHUE, Proprietor.

OILS AND LAMPS BY LATE ARRIVALS.**STANFORD BROTHERS HAVE RECEIVED**

A GREAT VARIETY OF COAL OIL LAMPS of every style of BUILDING known to the trade.
BRACKET LAMPS AND SIDE LAMPS with the largest burners in use for PARLOR AND STAND LAMPS—An endless variety of Patterns.
CHAMBER LAMPS AND HAMBLE LAMPS—Very cheap; may be used about.
CHANDLIER'S AND LANTERNS.
CAMPHENE LAMPS OF ALL KINDS.
COAL OIL AND CAMPHENE WORKS.
CHIMNEYS, SHADES, GLOBES—Of every size, style and finish.

200 BARRELS SPERM OIL—At a lower price than ever before sold in this city.
100 BARRELS LARD OIL—Of our own importation.
600 TUBS LAKE SEED OIL—in original packages.
100 BARRELS BOILED LINSEED OIL—guaranteed pure and free from salt.
400 CASES DOWNHILL'S KEROSENE.
800 CASES COAL OILS—At the very lowest market prices.
1,000 CASES CHINA OIL—in 2½ gal. tins.

We feel confident in assuring our CUSTOMERS and the TRADE generally that they will find our assortment of LAMPS and LAMP STOCK, as well as OILS and all kinds of BURNING MATERIALS, the most complete has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms we are determined to fix our prices at a standard or low that dealers in line of goods can lay in their Winter Stocks, and have a wider margin of profit than they have ever had before.

BARRON & CO. HAVE REMOVED to the northeast corner of Montgomery and Jackson streets.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, DECEMBER 21, 1861.

NO 14.

SOUTH-EASTERN CALIFORNIA SILVER MINES.

Our engraving is a condensed map of the Southern portion of California, west and east of the Sierra Range—showing the locality of the various mining districts lying in South-Eastern California. Riches beyond computation are hidden in that portion of our State.

In appearance the country is said to be barren in the extreme, and in a great measure destitute of timber—apparently set apart entirely for the purpose of stowage of minerals, and undoubtedly liberality was the predominant characteristic of the bestower.

We have in former numbers of the Press, given items from some of these new districts, and will be pleased from time to time to give such other items as may be furnished us by those who have traveled through or examined the mines on the Eastern Slope. Our aim and object is to make our paper peculiarly valuable to all parties interested in mining; we therefore will acknowledge ourselves under obligations to any party who will give us reliable information concerning anything and everything appertaining to such interests.

Among the richest and easiest of access of the districts

laid down on our map is the well known Coso District. Communication between Visalia or San Pedro and Coso is open the year round.

The ledges are numerous but only partially developed as yet. The company, which may justly claim to be the Pioneers of this district, is styled the Coso Mining Company, which was incorporated Aug. 2nd, 1860, and have had fifteen hands employed constantly since, in running tunnels and prospecting ledges, of which the company own seven, viz: The Silver Mountain, Pioneer, Copper Point, Mammoth, Three-Inch Hughes and Granite Springs. Six shafts have been sunk on the Pioneer and one on the Mammoth, also a tunnel run of 150 feet, striking the Pioneer at a depth of 300 feet, with a similar tunnel on the Copper Point.

The company have sent forward a twelve stamp mill, driven by a forty-horse power engine, which will ere long be in operation, and we trust repay the company handsomely for their investment.

In conclusion we give the following correct copy of an as-

say, made by one of our city assayers of 36 lbs. of Coso Rock.

Weight of Bar 8.09 ounces.			
Fineness.	Value per ounce.	Value of Bar.	Value per ton.
Gold 0.08.	\$0.16.	\$1.34.	\$74.32.
Silver 3.9.	0.51.	4.16.	231.42.
Total 407.	\$0.67.	\$5.50.	\$305.74.

Another made of Ophir rock, Mount Tautaurus, Coso District (quartz mixed with copper glance). One ton (2000) contains, silver,.....\$18 35.
" gold..... 301.

Total.....\$319.85.

And still another from the Melpontian (copper ore containing metallic gold.) One ton (2,000 lbs.) contains:

Silver.....84.80
Gold.....316.50

Total.....\$401.30.

California Manufacturing Interests.

We find the following well written article on Manufacturing Interests, in a late number of the *Red Bluff Independent*.

There is no doubt but that California is destined to become, at some future day, a manufacturing State; and the only reason why so little attention has been paid to this branch of industry heretofore, is, the high price for labor, and large interest which capital has commanded. But still, notwithstanding the high price of labor and rates of interests, we believe that woolen manufactories would pay as well as any business operations conducted in this State. In the first place, the raw material costs but a little over half the price paid for it in the Atlantic States, and the manufactured goods would bring a much larger price than the same could be sold for in the East. Wool is becoming a great item of California production, and it is to be regretted that our wool-growers are obliged to depend upon an Eastern market for the sale of their wool crop, receiving only from ten to sixteen cents per pound.

California is being noted as a wool-growing State, the amount produced largely increasing each year, and improved in fineness and quality by the introduction of fine blooded sheep. Now, what seems to us very poor economy is that Californians should pay the freight, commissions, cartage, storage, percentage of speculators, &c., &c., on this large amount of wool transported to the Eastern States to be manufactured into cloths, blankets, &c., and buying back the same clothes and blankets, again paying the same commissions, freight, percentages, &c. &c., when, by a little enterprise, the whole wool crop could be profitably worked up in this State. If some of our enterprising citizens had, instead of building flour mills, invested their funds in a woolen mill, we think they would have realized much larger profits from their investments.

Tehama county is already noted for her fine wool and blooded sheep, and we hope at no distant day to see every pound of wool raised in this county manufactured at home.

A woolen mill located at Red Bluff would be a great advantage to the place, and prove remunerative to the enterprising builder. It may be rather early to agitate a question of this kind, but it is bound to spring up, for the country demands it, and what is more, they will be paying institutions. The pioneer company who erected the first woolen mill in this country will make a fortune. Who will be the pioneers in this enterprise? Here is a good opening, and some intelligent persons will improve it.

Military Inventions.

A great many excellent inventions in the military line have been developed since our national troubles commenced. Many of those which have been patented are already in extensive use in our army, and the patentees are reaping a rich harvest.

Other inventors of equally meritorious contrivances for army uses, refrain from securing protection by Letters Patent, on the ground that the war will probably be short, and that the demands for improvements in that line will then cease. Such reasoning is fallacious, for if our present difficulties are brought to a determination as early as the most hopeful predict, it will be public policy to have a national army of considerable force hereafter, and the monopoly of the manufacture and sale, for seventeen years (the time for which a patent is granted), of even so small an article as a belt buckle, which is of universal use in the service, would produce to the patentee a very handsome income; while improvements in other departments, of dress or equipment, would be still more profitable.

All the most effective weapons of warfare in use are subjects of Letters Patent. We call to mind the following variety of patented inventions which have recently been secured through this office, and are now in use in the army, many of which have been illustrated in these columns:—Cannon and projectiles, by Parrott and others; camp hats, tents, cots, rifles, pistols, ramrods, bayonets, camp chests, canteens, epaulets, stirrups, stoves and caps. Then there is Tower's patent spur for cavalry, and we presume some other inventions are now in use, which were not patented through this office, concerning which we possess no knowledge.

The war is likely to develop ingenuity in its line equal to that which has heretofore displayed in other departments of industry, and we can wish patentees no better success than to hope they will all make as much out of their war inventions as some patentees have realized from their patented agricultural machines.—*Scientific American*.

The Fly-Wheel and Its Use.

Many have supposed this wheel to be an increaser of power, whereas it is, in reality, a considerable destroyer of it; which appears evident, when we consider that it has no motion of its own, but receives all its motion from the first mover, and as the friction of the gudgeons, and the resistance of air are to be overcome, this cannot be done without the loss of some power; yet this wheel is of great use in many cases; namely:

1st. For regulating the power where it is irregularly applied; such as the treadle and crank moved by the foot or hand; as in spinning-wheels, turning-laths, flax-mills, or where steam is applied by a crank to produce a circular motion.

2nd. Where the resistance is irregular, or by jerks, as in saw-mills, forges, slitting-mills, powder-mills, &c., the fly-wheel by its inertia, regulates the motion; because if it be very heavy, it will require a great many little shocks or impulses of power to give it a considerable velocity; and it will, of course, require as many equal shocks to resist or destroy the velocity it has acquired.

While a rolling or slitting-mill is running empty, the force of the water is employed in generating momentum in the fly-wheel; which force accumulated in the fly, will be sufficient to continue the motion without much abatement, while the sheet of metal is running between the rollers; whereas, had the force of the water been lost while the mill was empty, its motion might be destroyed before the metal had passed through the rollers. Where water is scarce, its effect may be so far aided by a fly-wheel, as to overcome a resistance to which direct force of the water is unequal, that is, where the power is required at intervals only.

A heavy water-wheel frequently produces all the effect of a fly-wheel, in addition to its direct office.

Alloys.

Alloys are generally more oxidisable than their constituents taken singly. This probably arises from the circumstance of one of the metals being electro-negative with respect to the others, by which means electric action is set up, and the more positive metal rapidly oxidised.

The action of acids on alloys varies according to the relative amount of their constituents. Silver alloyed with a large quantity of gold is protected from the action of nitric acid, by which, under ordinary circumstances, it is rapidly attacked. Sometimes, however, the reverse of this takes place, and metals which are totally insoluble in certain menstrua are made to dissolve in them by the addition of a metal on which they have the power of acting. In this way, platinum, although of itself insoluble in nitric acid, may be dissolved by it when sufficiently alloyed with silver. Alloys consisting of two metals, the one easily oxidisable, the other possessing a less affinity for that element, may be readily decomposed by the combined action of heat and air. In this case the former metal will be rapidly converted into an oxide, except perhaps the last portion, which may in some degree be protected from further action by the oxide already formed. The increased affinity for oxygen exhibited by the more oxidisable metal, in presence of another less affected by this agent, is doubtless an electric phenomenon, and the action is in many cases so rapid as to produce combustion. This occurs when an alloy of three parts of lead and one of tin is heated in contact with air.

SALMON MINES.—We lately met an old acquaintance, who had come directly from the North Salmon river mines. He had in his possession, about three thousand dollars, the product of a little more than a month's mining with a rocker. He states that the district known to be rich is but small, and believes that the multitude preparing to go there in the spring, will meet ill-success and disappointment. So intense was the cold, six weeks ago, that the miners used hot water to thaw the ice from their rockers. Two men at work there lately took out sixteen pounds in a single day.—*Placerville News*.

Mono Esmeralda.

A correspondent of the Tulare Post writing from Kern River under Date of Dec., says; Small parties arrive every few days from these Districts. They report a heavy fall of snow before leaving, and still snowing when they left. Mono is about "played out" for this season, not exceeding 8 or 10 persons remaining to tell the tale of its marvellous wealth in the past, or chant a requiem o'er the wreck of its *quondam* splendor. Esmeralda is growing in importance, in wealth, population, and all the elements that denote prospective prosperity in a mineral country. A great many will remain there during the winter developing their claims, having made all necessary preparations for the severest weather that may be expected. In due course of time Esmeralda will rival Washoe in the production of that glittering material which secures comforts and necessities, purchases luxuries, sears consciences, undermines governments and widens the trails which lead to Hell.

Coso.

From this District we continue to hear flattering news. There is no humbug about the gold-bearing portion of the reports brought in by "prospectors" being acquainted with parties engaged in grinding that kind of rock, having handled the proceeds and knowing personally that large amounts have been offered in cash (and refused) for some of the claims which have been opened. Most of the parties engaged in opening their mines, expect to work them on their own account and realize wealth legitimately; and should they desire to sell interests, they need not resort to the "Bailey & Dewy" process of manufacturing ore to relieve the too grasping and credulous speculator of his surplus capital, having an abundant supply of the *simon pure* article which yield to the magic touch of honest labor, and the practical application of genuine science. Machinery for the "Silver Mountain Co." was met 6 days since near "Little Owens Lake," from which, when erected and put in operation, great results are anticipated. Machinery for Messrs. Hitchens & Muirroe destined for the same District, is now

going up Kern river, having crossed the mountains safely, and will reach its place of destination in about 10 days. The Lode for which the latter will be erected is one of the best gold-bearing we have ever tested, and if the proprietors do not realize immense fortunes, it will be because of bad management.

New Brick Machine.

Among the latest specimens of ingenuity which has been brought to public notice, is a patent brick machine, which promises to supersede hand labor. The model has a reception box into which the clay is put, and by revolutions of flanges speedily mixed. It then drops into the circular moulding table, divided into sections. Each section contains two forms, and by one revolution of the moulding table of a machine of two horse power, eighty-six brick, either plain or pressed, can be turned out. The application of steam power will increase the quantity of brick manufactured. The model, which is compact, simple, and apparently effective, is the result of some years experimental labor, the inventor being Frank Green, for some time past a resident of California, and who has made this State his permanent home.—*Alta*.

Hematite.

This very abundant mineral occurs of various shades of red, brown and black. It never assumes a crystalline form, but is always of a fibrous structure, and occasionally botryoidal and stalactitic; sometimes coating crystals of *Quartz* as in Cornwall. Externally the mass is often black and shining, and even iridescent. Hematite is plentiful in a vast number of localities in England, Scotland, France, Germany, Poland, Russia, and the United States. It affords a very tough, compact cast iron, and is also converted into malleable iron of superior quality; in America the best iron both malleable and cast, is obtained from the brown-colored variety.

Red ochre is a variety of Hematite which is soft and greasy to the touch, and stains the fingers with a light red color, it occurs with, and coating, the other varieties.

Lepidokrochite.—This resembles Hematite in external characters and in main composition, but it contains, in addition, some Phosphoric acid. It is found only in Thuringia, and is a rare mineral.

SUBSTITUTE FOR POWDER.—A composition which tamped in the holes bored for blasting rock in the same manner as powder and ignited by a fuse, and does not cause an explosion upwards like gun powder, but generates great heat which splits the rock, has recently been adopted in France. This composition is made by combining 100 parts of sulphur, 100 of saltpeter, 50 of dry saw dust, 50 of horse manure, and ten of common salt. The salt and saltpeter are dissolved in hot water, to which four parts of molasses are added, and the whole of the ingredients then stirred together until thoroughly incorporated in one mass, which is then dried by a gentle heat in a room or by exposure to the sun, when it is fit for use.

GALENA.—Improvements are progressing rapidly in this district. Messrs. Swift, Harbin & Co. have purchased of Sandy Bowers, of Gold Hill, his entire interest, at the respectable sum of \$250,000. They design building two additional quartz mills, capable of crushing one hundred tons per day. The mills will be erected on Steamboat creek, in the above district. We understand that Atkinson, Kinkead & Co. will effect a compromise with Messrs. Lovejoy, Grishy and others, relative to water rights now in dispute, thus giving to Washoe City a desirable impetus, it now being the county seat of Washoe county.—*Silver Age*.

NEW GOLD MINES.—A correspondent from Pas de Rohles informs the Los Angeles Star that a gold discovery has been made on Estrella creek, in San Luis Obispo county. The gold is said to be of very fine quality and prospects from twenty to thirty cents to the pan. The placers are thought to be extensive, but have not been thoroughly prospected. Several miners have taken up claims and will commence operations as soon as water can be brought into the claims.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

NATHANIEL GRAY, General Undertaker,
641 Sacramento street, corner of Webb,
(Between Kearny and Montgomery.)
no 20

Established 1850.

LEWIS COFFEY & RISDON'S
STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Boiler Making Establishment on the Pacific Coast Owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market Streets.

Opposite Oriental Hotel, San Francisco, Cal.

Mining Companies and Associations.

Office of the Padre Gold and Silver Mining Company, 215 Front street, San Francisco, September 26, 1861.—Notice is hereby given that an assessment of one dollar per share on the capital stock of this company, was levied this day to be paid in installments at the office of the company as follows: Twenty five cents per share, on or before the 20th inst.; twenty five cents per share on or before the 20th October proximo, and fifty cents per share, on or before the 20th of Nov., 1861.

Shareholders will take notice that delinquent stock will be proceeded against in strict conformity to law.

By order of the Board of Trustees.

JOS. P. NOURSE, Sec'y.

St. Louis Gold and Silver Mining Company.—Notice is hereby given that the Board of Trustees of the St. Louis Gold and Silver Mining Company have, this 15th day of October, 1861, levied an assessment (for completing their mill) of two dollars upon each share of the capital stock of said company, payable to the Secretary, at No. 40, Montgomery Block, San Francisco.

By order of the Board of Trustees.

J. H. BREWER, Secretary.

Office of the Cole Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cole Silver Mining Company held Oct. 25th, 1861, an assessment was levied of one-tenth of one cent on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.

J. B. COFFIN, Sec'y.

Office of the Padre Gold and Silver Mining Company, 215 Front street, San Francisco, October 24th, 1861.—A meeting of the stockholders of the Padre Gold and Silver Mining Company, will be held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting, by order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees.

JOEL F. LIGHTNER, Secretary.

Office Gould and Curry Silver Mining Company, November 5th, 1861.—Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which was made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HINGINGS, Secretary.

Office Crown Point Gold and Silver Mining company, 321 Front st., San Francisco, Oct. 20th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

Office Norman Silver Mining Company.—Notice is hereby given to all stockholders in the Norman Silver Mining company, that an assessment of fifty cents upon each share of the capital stock of said company was duly levied on the 5th day of November, 1861, and is payable on or before the 10th day of December, 1861, to Chas. Ludington, at Virginia City, N. T., or to the Secretary of the company, at No. 40 Montgomery Block, San Francisco.

By order of Board of Trustees.

J. H. BREWER, Sec'y.

Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 10th of December next, at the office, as above.

J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 25th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City, or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.

All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOSH. S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty sixty or ninety days from date, to the Treasurer of the company.

By order of the Board of Trustees.

JOSH. S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees.

HENRY S. HUDSON, Sec'y.

Office Chollar Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the stockholders of this company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

W. E. DEAN, Sec'y Chollar S. M. Co.

A Meeting of the shareholders of the Summit company will be held at the Gold Hill Bakery, in Gold Hill, on Friday, Nov. 15th, at 7 o'clock P. M. Punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.

JOHN BOHLE

Office Ballou Gold and Silver Mining company, Van Horn District, 305 Montgomery street, San Francisco. Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock P. M.

T. L. HUBBINS, Sec'y.

SAVAGE Gold and Silver Mining company. A meeting of the stockholders in the above company will be held at 10 o'clock, A. M., the 17th day of December 1861, at the office of Lent, Sherwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Morrow at Virginia City, to A. K. Head, Nevada; or the undersigned before the 14th day of December next.

WM. M. LENT, President.

San Francisco, November 27, 1861.

NOTICE.—There will be a meeting of the Soles Gold and Silver Mining company, on Sunday, November 17th, 1861, at 11 o'clock A. M., at the house of M. H. Bryan, Virginia City.

A punctual attendance is requested, as business of importance will come before the meeting.

no29

M. H. BRYAN, Sec'y.

SHAREHOLDERS of the Osceola Gold and Silver Mining company are hereby notified that the meeting of the Trustees of said company in Virginia City, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to F. H. Russell, Virginia City.

Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Ludington & Russell, in Virginia City, on Saturday, the 10th day of December next, between the hours of twelve and three P. M.

J. S. WATKINS, Treasurer, Osceola G. & S. M. Co.

Virginia City, Nov. 2, 1861.

Office Uplift Silver Mining Company, San Francisco, Nov. 20th, 1861.—The Annual meeting of the stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 11 o'clock, A. M., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

JAS. W. WHITE, Sec'y

NOTICE is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia City, N. T., on Saturday the 23rd inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

R. T. SMITH, President Arizona Company.

NOTICE.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "San Rita," "Guasabach," "Fortuna," "Santa Cruz," and "Nacimiento," situated near San Antonio, Lower California, Mexico.

CHAS. J. DUPRAT,
EM. LEYLA,
DUPRAT, SCHMITZ & CO.,
CHAS. KRAFT & CO.,

La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California. For further particulars respecting the above named mines, inquire of

JOS. J. DUPRAT,
423 Washington street.

GOLD HILL TUNNEL CO.—The meeting called for Saturday, November 9th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the saloon of Webb & Coppers, Gold Hill.

A punctual attendance is requested, as business of importance will come before the meeting.

ROBERT APPLE, Sec'y.

SHAREHOLDERS of the Caledonia Gold and Silver Mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 20th inst., to the Superintendent, at his office in Gold Hill, or to WM. B. AGARD, San Francisco.

Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 9th day of December next.

By order of the Board of Trustees,

Gold Hill, Nov. 4th, 1861.

POSTPONEMENT OF SALE.—The sale of mining ground, at Silver City, by the Kansas Mining company, is postponed until four o'clock, P. M., Tuesday, Nov. 19th, 1861. Sale to take place on the grounds of the company. Delinquents will please take notice and "come to time."

By order of the Board of Trustees.

R. C. CHAPPELL, Sec'y

TODAS SANTOS COMPANY.—The members of the Todas Santos Company are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary on demand. Also that the several interests of the members, who fail to pay their said assessments, on or before the 10th day of November, instant, or so much thereof as may be necessary to pay said assessments, together with cost of advertising and sale, will be sold at Public auction to the highest bidder, on Wednesday, Nov. 20th, 1861, in front of the office of John Kelly, on B Street, in Virginia.

By order of the Board of Directors.

EL. W. FERRIS, Sec'y

GOLDEN GATE COMPANY, GOLD HILL DISTRICT.—A meeting of the shareholders in the above named company will be held at the office of H. O. Gaylord, in Virginia, on Saturday, Nov. 16th, at 7 P. M.

By order.

T. A. MONKHOUSE, Sec'y.

MEMBERS of the Senator company, Congress Ledge, Devil's Gate District, are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

L. W. FERRIS, Sec'y.

MARKET STREET RAILROAD

DURING THE WEEK CARS RUN FROM SAN FRANCISCO TO MISSION AND WILLOWS:

FROM MISSION From 9½ A. M. to 11½ P. M.

Connecting with the Hayes Valley Car and Lone Mountain Omnibuses, from this date.

ON SUNDAYS AND PEAST DAYS.—A new set of large and convenient cars will be added for the accommodation of the public.

A. ROMAN & CO.
Booksellers, Importers, Publishers,
507 MONTGOMERY STREET,
SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 560 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc., Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Rudimentary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lam born.

The Discovery and Geognosy of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Disquisition on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....DEC. 21, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEROTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of this Press will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

The Future of the Pacific Slope.

No country in the world has ever presented opportunities for acquiring wealth equal to California or the Pacific Slope. We often hear men say that the "time for making fortunes in a short time" is past. We beg to differ; instead of this being the case in our estimation, the people along the Pacific Coast are but fairly entering on their prosperity. Materials of wealth are scattered profusely all over the land; all it requires to make this wealth available is good judgement and willing bauds; the possessor of these requisites is sure of acquiring a competency at least, in much less time than the same result could be accomplished in any other land. There is not a healthy man or woman in our midst, who is willing to labor, but can always find plenty of employment; and there is no employment diligently prosecuted but compensates the laborer handsomely, above any ordinary wants necessary for health and comfort. As we said before, all that is required in being successful is the exercise of good judgement and willing hands to labor.

Our lands are prolific and fertile; already are our valleys teeming with splendid edifices, surrounded by luxuries such as no other land affords. Our farmers are fast becoming opulent; our mountains are covered with inexhaustible forests; our rivers abound with fish; the whole extent of our country is rich in mineral. The man who says our mines are worked out is an idiot; they are not yet fairly opened.

Gold fields of great extent are but just opening; hundreds of miles of the Pacific Slope are not yet prospected: from the Colorado to the Russian possessions north, is one continuous field of ore. The mineral wealth of the Eastern Slope of the Sierra Nevada range is far greater than that on the Western Slope. We predict that in 1870 the annual production of gold and silver from Nevada Territory alone, will amount to one hundred million dollars. We are not given to over estimating. We know the country we speak of and know we speak nothing but truth. All admit the silver mines of Washoe to be extremely rich; but they are no richer than those of Esmeralda, White Mountain, Coso and the Colorado, all are nearly equally rich.

Neither are the mines of the Western Slope exhausted. It is true the placer diggings are worked to some considerable extent, but they are yet giving employment to thousands of our industrious citizens, and new diggings are daily being discovered.

Quartz mining is also becoming better understood, and is found, when prosecuted systematically to pay handsomely. We know of one person in one of the interior counties who realizes a net profit of from ten to twenty thousand dollars every month, from crushing rock that pays not above twelve dollars per ton on an average. In truth our country is but in its infancy, and wise is he who will take advantage of this fact, and not accordingly.

Thousands of the oppressed from all lands here seek an asylum; we say, come along: we welcome you. If you are industriously inclined you will never regret coming; you will do well, as will many of those who come after you.

Disastrous.

Accounts from all parts of California confirm us in the belief that the late storm, or succession of storms, was the most severe and disastrous ever known. It commenced about the 11th of November, at which time there was a light fall of snow on the mountains. On the 13th it commenced snowing in good earnest, and in a very few days the snow on the Sierra range was no less than six feet in depth; during all this time heavy rains were falling in the lower foot hills and valleys. On the 25th it again commenced storming, and with the exception of a few days of sunshine and fair weather intervening, now and then, kept on until the 9th of December. Instead of snowing on the mountains, as is usually the case this time of the year, it rained; the snow vanished in haste; the natural consequence were unprecedented floods all over the State. The damage done by the overflow of inland cities and towns is very great, but the damage outside of the cities is much greater. The mining interest in every part of the State has suffered immensely. This loss will be felt more materially than any other, although the farming community and other interests have also suffered. Our exports of gold for the month of December will exhibit a marked decrease. The merchant of San Francisco, and traders over the whole State, will feel the effects of the calamity. It will require months of labor and industry to restore us to where we were before the flood.

Mining ditches were washed away for miles; reservoirs broke; bridges went down stream; public roads were washed away and cut up, until travel is in many places entirely stopped. California presents truly a sad picture, and did we not have unlimited confidence in the recuperative energies and capabilities of the people of California, should almost despair of ever seeing things righted again; but in this State the word fail is almost obsolete. The energies of the people are equal to the emergency, and in a very short time the foot-prints of the great and disastrous floods of 1861 will have vanished, and the loss sustained by so many classes of our community entirely forgotten. "So mote it be."

Tuolumne County.

From a private letter dated Sonora, Dec. 11th, we make the following extract:—

Sonora is quite a lively city. The main street is nearly one mile in length, and is occupied principally by business houses; business of all kinds apparently being brisk. The mines in the vicinity of Sonora are still paying very good wages. A large flume is being put in Wood's creek, which, when completed will be of great benefit to the miners all along the creek to Brown's flat.

Shaw's Flat and Saw Mill Flat are mining camps of good size. These localities have been worked from an early day, and are paying well at the present time. Most of the claims are paying from five to eight, and some of them as high as twelve dollars a day to the man.

There are no big strikes made now-a-days, but everything seems to be going on steady. The miners as a general thing are well contented; satisfied that it is better for them to work their own claims than to be running after every excitement.

The various quartz veins which are being worked at the present time in this county are nearly all paying largely.

The vein from which the mill formerly owned by S. Platt, (lately purchased by Mr. Davidson for \$9,000) is supplied, is very rich. Rock from the Solsby vein is paying an average of one hundred dollars a ton.

A new vein was quite recently struck on the north fork of the Tuolumne river, half a mile from Pine Grove, which is supposed to be very rich. Besides gold the rock contains considerable quantities of Galena. The placer mines in the vicinity of Pine Grove Village are good. Many claims now open pay from six to fifteen dollars a day to the band.

A company of men are engaged in running a tunnel through a hill a distance of three hundred feet, which when completed will open many new claims, and give excellent fall for running off top dirt. The gold in this locality is generally found near the bed rock.

The number of miners in this vicinity is about eighty.

Vanhorn District.

This mining district, situated about twelve miles east from Aurora, was discovered by Dr. Farnham, while on a hunting excursion in April last. Owing to so many new discoveries lately, or because of the out of the way place of these new mines, we have heretofore heard but little from the above named district.

A person lately from there gives us the following items concerning these mines:

The principal ledges are named the Farnham, Williams', Crittenden, John Bell, Seco & Chalmers, each 1400 feet in extent, owned by a company composed of five or six energetic gentlemen. The owners consolidated their interests and were incorporated in August last, under the name and style of the "Bullion Gold and Silver Mining Co.," with a capital stock of \$960,000, or 9600 shares at one hundred dollars each.

Harris & Co. of Aurora, assayed croppings from the Farnham lode, which showed a return per ton (of 2240lb) in silver, \$139 85, in gold \$81 02, total value per ton \$220 87. The company, we are informed, has a special fund on hand, sufficient to develop their mines and erect necessary machinery; hence their improvements do not depend on the levying and collection of assessments, which, where companies are composed of a large number of persons, is always a great drawback on the development of new mines.

The company owns two springs of water, quite sufficient for their use. Wood is said to be abundant in the vicinity, and the mines accessible over a good wagon road, diverging from the Aurora road, near Evan's ranch.

The author of the above facts is a gentleman who spent most of the summer in the vicinity of Vanhorn district, and in whose statements we have confidence.

For Sale:

Feet in the following valuable Silver lodes:
25 feet in Cedar Lode, Esmeralda District.
100 " Golden King " "
25 " Bright Star " "
116½ Bogus " " "

A portion of the above ground would be exchanged for a billiard table.

For particulars enquire at this office,
Corner of Washington and Sansome sts.

Dr. Henry Degroot.

We were pained to hear of the serious illness of our friend Dr. Degroot, at Aurora. His complaint—erysipelas in the head, from which he has suffered at intervals during the past three months, has prevented him from following his usual vocation.

In our estimation, no man in all Washoe has been more useful, nor deserves better success, hence we hail with pleasure the intelligence given to us of his again being convalescent, and of the entire disappearance of the malady.

To Miners and Mill Owners.

CALIFORNIA.

Mono County.

[From our regular correspondent.]

АКРОА, Dec. 13th, 1861.

The mill of Avery & Co., two miles below the town, on Esmeralda Ravine, has an engine of thirty horse power, and two straight batteries of four stamps each. It employs seven of Varney's pans in amalgamating and is working successfully. Moses & Young's mill on the same ravine, but not

NEVADA TERRITORY.

The Territorial Terrapine says of the Gould & Curry Mill, in Nevada, that it is the largest in the Territory. It is built in the form of a cross, the main building being two hundred and fifty feet long. The engine is fifty horse power, and the steaming apparatus consists of six furnaces and three boilers, twenty-six feet long and forty-two inches in diameter. The battery is one hundred and twenty-five and long fifty feet wide, containing forty stamps, the whole being capable of crushing forty tons of ore per day. The number of men now employed in the mill is thirty, and as soon as contemplated additions are completed the number will be doubled. The mill is situated on the Ledge are cutting and grading a road from the ledge to intersect the Carson River road, a distance of about two miles. The rock will be crushed at the mill on Carson River, and very rich returns are expected. - The Territory of Nevada has the mineral resources to make her a great and prosperous State in the course of a few years. But now she is young and feeble and needs the fostering care of government. We need a mint, a land office, and as soon as possible a slave state. We need a congressional district, a well equipped army, and a railroad, from California, at least. The time will come when our people will undoubtedly have the means to put this latter project through, with the aid of California. But we ought to have it built at this moment—our actual wants demand it at the earliest possible moment.

More about the Cariboo Mines.

Mr. J. C. Beedy, formerly La Porte, whom we mentioned a few weeks since as being a trader at Lillooet, on the Fraser, has returned and favors us with further advice concerning the Cariboo mines. He considers our former article mainly correct, but represents to us another and a darker side of these celebrated diggings. The country is one vast swamp of mire. Weather wet and stormy through the whole mining season, the miners having to work continually in a damp condition. Not one sturdy miner in a hundred can endure the exposure. On the first of August last snow fell to the depth of six inches.

From the Forks of Quesnelle, the highest trading point, it is 40 miles to Antler Creek, the first diggings in the district; and 10 miles thence to William's Creek; and 15 miles further to Lightning Creek. Every particle of food taken into the mines before the first of July has to be packed upon men's backs, the above mentioned distance, through mire knee deep much of the way.

The British laws governing the mines require the holder to be at the diggings by the first of June, and claims are only nupjable from the first of October till the succeeding June.

Another California Patent.

Messrs. Keep & Briggs, of the Globe Foundry, in this city, have received letters patent (No. 2,248,) dated September 10th, 1861, for an improvement in horse-power machines, the patent extending a term of seventeen years. This machine has been frequently referred to in our columns as the best ever introduced into this State, a fact which has been practically and satisfactorily demonstrated by farmers in this county who have applied them to threshing machines during the past season. The improvement consists principally in the manner of applying the power, and originated in a practical observation of a necessity, visible in nearly all imported machines, for such a change as would secure the object of more power and less complication, in both of which respects the inventors have succeeded, and have obtained a patent therefor. We predict that by another season, the Pitts' Smith's and other powers which have hitherto been in use in this county, will be superseded by the patent power of Messrs. Keep & Briggs.—*Stockton Independent.*

More Copper Ore.

One hundred and fifteen sacks of ore, from the Copper Hill Mining Co., near Campo Seco, were shipped to San Francisco on Thursday, by Messrs. C. T. Meader & Co., of this city. It forms part of a lot of 400 sacks, which will be forwarded to Boston for assay, upon the next ship leaving. The samples are inferior to the ore from the Copperopolis mines; but this fact may be accounted for, since the ore is but the carburets of copper, differing materially in weight and value from the sulphurets. The first specimens shipped from this new copper region, showed an average weight of 85 pounds to the sack; since which time, as the miners reach a better quality of rock, the weight has increased to upwards of 100 pounds to the sack. The section of country surrounding these mines, is said to offer, in geological appearance and in the partial prospect which has been given to ascertain its value as a copper region, a field quite as extensive and rich as that of the 'country' round about Salt Spring Valley.—*Stockton Ind.*

From Australia.

The finding of numerous nuggets, weighing from 100 to 300 ounces, is reported at Kingover. They were found near the surface, over a great area. The quartz mines are yielding well, at great depths—say from 63 tons 215 ounces, from 80 tons 215 ounces, from 55½ tons 232 ounces, and from 249 tons 1145 ounces. The amount of dust received at Melbourne from Jan. 1st to Aug. 23d was 1,196,732 ounces, which is a falling off from the amount received during the same period last year of 1,185,549 ounces. There is great excitement in Australia about the Otago gold mines in New Zealand. A ship with \$60,000 arrived at Sydney and onewith \$15,000 at Melbourne. The general opinion in New Zealand, however, is that the goldfields promise well, and that the ground already opened is a portion of a large auriferous district. Small diamonds are occasionally found in Australia. The New Colonial Parliament is said to be ultra Democratic and incongruous.

Cost of Articles at the New Mines.

The Vancouver *Chronicle* gives the prices of necessary articles, together with a little sensible advice: Everything sells high; shovels, \$12; picks, \$8; axes, \$8; leather boots, \$16; gum boots, \$20; coffee, sugar and bacon, 70c per lb and everything else in proportion. It will not be amiss for us to warn those, who have made up their mind to go, against a precipitate departure without preparing sufficiently for their maintenance during the winter. From accounts worthy of credence, the snow will fall very deep; all kinds of goods are held at a high price and it is impossible to work or prospect claims, while the winter season lasts. It would seem advisable, to remain until spring, and then enter upon the gold-fields with fresh vigor and energy, and well provided with the necessities of life.

A water proof composition for boots and shoes, can be made by taking a pint of boiled oil and three ounce each of oil of turpentine, black rosin and beeswax. Melt the wax and rosin, then stir in the oil and remove the pot from the fire, when it has cooled a little, add the turpentine. Give the boots two or three coats with a common blacking brush.

NEW MINE OF QUICKSILVER.—A gentleman named F. Barrow, a few days since, struck a rich deposit of cinnabar in a bank a few feet from his mill at Lexington, Santa Clara county. His first attempt at retorting produced so large an amount of quicksilver that he thought he had been tampering with his retort.—*Independent.*

PIONEER WOOLEN FACTORY.—The San Francisco Pioneer Woollen Factory Company filed a certificate of incorporation. Their purpose is to manufacture blankets and other woollen fabrics. The capital stock is \$100,000, in shares of \$1,000 each. Frederick P. Salomons, Leopold Cahn and Gustave Ris, are the first Board of Trustees.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the 5 years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is two per cent., against two per cent., wasted by our own mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,239. Under Mr. Hempstead, the total expenditures for the same years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. Retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of this state at large. The charges are as follows:

For parting silver from gold when gold

is below 300-1000ths fine.....3cts per
" from 300-1000ths. to 750-1000ths fine, 7cts " "
" " 750-1000ths to 950-1000ths " .14cts "

DEPOSITS SILVER BULLION.—PURCHASES.

\$1.21 per standard ounce ½ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cts. per standard ounce, ½ per ct. gross value of silver for making bars; also when gold is contained per ct. on gross value of gold for coining. Refining charges in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. ½ per ct. gross value to be added for making bars.

DEPOSITS FOR DOLLARS.

\$1 16-4-11ths. per standard oz. ½ per ct. gross value for coining, when gold is contained, refining charge the same in purchases.

DEPOSITS FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. ½ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1. per standard oz., and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge ½ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver registers as most congruous with the physical aspects of the material but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent. three cents per oz., gross, in addition to the general rate and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

CIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to its extensive establishment, we can confidently announce to the public we now have
Best Foundry and Machine Shop on the Pacific Coast.

th upwards of forty-five thousand dollars worth of patterns, we are enabled to work cheaper and quicker than any other establishment on this coast of the Rocky Mountains.

make to order, and have for sale, High and Low Pressure Engines, Marine and Stationary; Straight Quartz Mills of all sizes and kinds; Stamp-mills and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three times longer than any other kind; Flouring Mills; Gang, Mulay, and Circular Saw Mills; Shingle Machines, cutting 25,000 per hour and more perfectly than any now in use. One of these shingle machines is now in operation at Metcalf's mill in this city.

our Amalgamators, with the latest improvements; Howland & Mansel's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use. Art Screens, of every degree of fineness, made of the best Russia Iron. Wheels and Axes of all dimensions; Building Frames; Horse Powers; and Mills; Boiler Frames; Wind Mills, of Hunt's, Johnson's and Lum's Patents; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Our work is promptly attended to. We are thankful to the public for their many past favors, we would respectfully request a continuance of their patronage. Before purchasing, give us a call and we will show you what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This Mill will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Barbota Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one of the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving the seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing ball or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no slide draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- 12th. We invite Farmers wishing a machine to call and see before purchasing.

No. 6 Battery Street, SAN FRANCISCO.

Particular attention paid to the MANUFACTURE of

KNOX'S AMALGAMATORS, QUARTZ MACHINERY, MANTEL CRATES, STOVE WORK, CALDRONS, ETC.

We also Manufacture

IRON CASTINGS, OF ALL KINDS.

SHAKSPEARE SALOON

CHAS. DUVEINECK.

Billiards, Fine Liquors and Havana Cigars

LYCEE BUILDING,

Cor. Montgomery and Washington streets.

PHILADELPHIA BREWERY,
Second street, corner of Folsom, SAN FRANCISCO, CAL.

Holscher, Wieland & Co., Proprietors.

Thankful for past patronage to a discriminating public, we beg leave to apprise at the same moment our many friends and patrons that the above well known Brewery has been permanently located in our new premises, on Second street—the former residence of Capt. Folsom, where we shall endeavor to continue in furnishing our numerous patrons with the best article of "Beer." We shall strive to perpetuate the good reputation for promptitude and the faithful execution of orders as heretofore, and thereby increase our custom.

Nov.9.

DEVOE & CO.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munn & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts., 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM DON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

ap25

CHLESAR MASON

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000
IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.

The Books of Subscription are open at the office of Pioche & Bayarquo where the required first instalment of 10 per cent. will be received.

E. L. A. PIOCHE, President.

m28

J. H. APPLEGATE, Secretary.

The annexed cut faithfully represents one of the old landmarks of San Francisco, situated on Battery street, below Pine. The entire upper story of this building is occupied by Prof. Frank Wheeler, for his Gymnasium, and the lower portion to Messrs. Wright & Roden, for their excellent Livery or Sale Stables.

Prof. Wheeler's Gymnasium ranks the first in this State, and will compare favorably to any in the Eastern cities. He has upwards of one hundred constant subscribers, and plenty of room for more. Spacious bathing rooms are attached to this establishment, the use of which are free to members. Mr. Charles Pool an excellent gymnast, leads the classes in the absence of Mr. Wheeler.

Messrs Wright & Roden are justly renowned for keeping the most cleanly and best ventilated establishment in this city. Their display of stock is not to be excelled in this State, and we would advise all those who have thoughts of purchasing, to certainly call upon this establishment.

This building was the one occupied by the Vigilance Committee in 1851, and has many interesting reminiscence connected with it, but the crowded state of our columns forbid a further notice.

Southern Mines.

Amid the general gloom pervading our State, consequent on the losses met with by the great floods, we occasionally find a gleam of sunshine, which verifies the old saying, "That is an ill wind that blows nobody good."

We are pleased to learn that the miners of Stanislaus, Merced and Mariposa counties, are doing exceedingly well since the late rain storms, having plenty of water at present to work in streams and gulches, which are usually dry, and which can be worked only while rain is falling, or immediately after heavy storms, while the ground is perfectly saturated and wet.

Many localities in the counties named are quite rich, but on account of their altitude and the impossibility of ever supplying them with water by artificial means, are only worked at such times as the present.

Wagon Road Survey.

In late Amador papers we notice a report of a survey made for a wagon road, from Antelope Springs to Carson Valley; from this we judge that the project has not been abandoned. Last spring much excitement was occasioned throughout Amador county on the subject of this road, a bill having previously passed the Legislature authorizing the people to vote to tax themselves to aid in its construction. The measure was voted down, however. We presume private enterprise will now accomplish the work. The initial point, Antelope Springs, is situated ten miles east from Volcano. From this point to Carson valley the distance is only fifty-three miles. The excavations on some portions of the route are heavy. The entire cost is set down at \$36,335.

Interesting Correspondence.

SAN FRANCISCO, Dec. 19, 1861.

EDITOR MINING AND SCIENTIFIC PRESS.—SIR.—In your issue of Dec. 7th, appeared a quasi-editorial article, to which my attention has just been drawn, commenting on an alleged process or modification of process by a gentleman of Nevada, of which I understand you to assert that it is the only process that will extract every particle of gold from auriferous ores. Now sir, I have had some little experience in the subject so cavalierly disposed of, and, though far from claiming that there do not exist ores from which every particle of gold may be extracted, by Mr Deetken's as well as by several other known methods, yet I do claim that there exists abundant deposits of auriferous ore from which the gold can not be so extracted, and I challenge yourself or Mr. Deetken to the proof.

Therefore I offer to wager yourself, Mr. Deetken, or any other person, who may choose to accept the offer, one thousand dollars that I shall produce auriferous sulphurets to be manipulated by the above or any other publicly known process, from which sulphurets the operator shall not be able to isolate over fifty per cent. of the content of gold, as indicated by assay.

R. D'ACMAILE,

at J. A. Peck Esq.,

Washington street.

SAN FRANCISCO, Dec. 20th, 1861.

EDITOR MINING AND SCIENTIFIC PRESS.—All I have to say in answer to the above communication is, that I do not pretend to work to an assay "any kind of sulphuret the gentleman may produce," being very well aware of the fact, that in instances where the auriferous sulphuret may be combined with any calcareous substance, the working of the ore by the process I follow would be a practical impossibility. Other circumstances, the low fineness of the gold, when combined with silver for instance, may tend to make the process impracticable.

But I do pretend to work to an assay auriferous pyrites of the nature I find them at the auriferous quartz districts of the Northern California Mines, and I have done so at the Nevada Metallurgical Works for the last eighteen months. The gentleman who honors me with the above notice will confer a favor upon me, by informing me of any other process, but that followed by Plattner, by which all the gold can be extracted from auriferous pyrites, such as are found in our quartz districts.

If the gentleman is willing to settle this question in any other way than by resorting to a bet, I shall be happy to let him know the result of my experiment.

G. F. DEETKEN, Mining Engineer.

Mining Stocks.

Our Reporter having neglected to give us a corrected list of prices of Mining Stocks, we have necessarily omitted the list this week, which we trust will not again occur in the future.

For Sale.

A great bargain is offered by a person who spent the past summer in the silver mines east of the mountains. Eight hundred feet in various excellent quartz lodes are offered for sale for a paltry sum—sufficient to enable him to make trip to Cariboo.

For particulars apply at this office.

Always Ahead of the Times.

Bisenthal, corner of Kearney and Commercial streets, has just received and is now opening a very large assortment of French and American Goods. Nothing can surpass our friend's taste and energy. He is always ahead of the times.

Everybody in want of Dry Goods of any and every description, will find advantageous to examine his splendid goods, before purchasing elsewhere. Remember the place. Corner of Kearney and Commercial sts.

Latest Style of Hats.

Our friend Meussdorfer, whose store is on Commercial street, has on hand a very large and beautiful assortment of the latest style of hats. We advise all in need of a hat to give him a call before purchasing elsewhere. His goods are of home manufacture, and are warranted to give satisfaction every respect.

NEW DRY GOODS.

S. ROSENTHAL, Corner of Kearney and Commercial streets, is now opening A LARGE AND ENTIRELY NEW STOCK

FRENCH AND AMERICAN DRY GOODS

Which will be sold at

UNUSUALLY LOW PRICES.

S. ROSENTHAL,

Corner of Kearney and Commercial streets.

dec17

UNION IRON WORKS (ESTABLISHED IN 1849)

N. E. Cor. First and Mission streets, San Francisco.

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the last twelve years, during which time new and extensive Buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS MACHINERY AND CASTINGS,

Of every description, on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Power, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work, Steamboat Repairing and Blacksmithing, etc.

STEAM ENGINES BUILT AND REPAIRED.

Besides the extensive assortment of Machinery Patterns, attention is called to the new and beautiful designs for Building Castings, Iron Fronts, Columns for Stores, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, etc.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & G. M. WOODWARD'S PATENT.—This Pump is used for supplying Steam Boilers, Mills and Public Buildings, with water. In case of Fire it arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the discharge Outlet. Its sublimely built Machinery and Mining purposes, being used in nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED. PETER DONAHUE, Proprietor.

OILS AND LAMPS BY LATE ARRIVALS.

STANFORD BROTHERS HAVE RECEIVED

A GREAT VARIETY OF COAL OIL LAMPS of every style of RUBEN known to the trade. BRACKET LAMPS AND SILE LAMPS with the largest burners in use. PARLOR AND STAND LAMPS—An endless variety of Patterns. CHAMBER LAMPS AND HANDLE LAMPS—Very cheap; may be carried about. CHANDELIER LAMPS AND LANTERNS. CAMPBINE LAMPS OF ALL KINDS. COAL OIL AND CAMPBINE WICKS. CHIMNEYS, SHADES, GLOBES—of every size, style and finish.

200 BARRELS SPERM OIL—At a lower price than ever before sold in this city.
100 BARRELS LARD OIL—Of our own importation.
600 TUBS RAPE SEED OIL—In original packages.
100 BARRELS BOILER LINED OIL—guaranteed pure and free from fish oil.
400 CASES DOWNNEY'S KEROSENE.
800 CASES COAL OILS—At the very lowest market prices.
1,000 CASES CHINA OIL—In 2½ gull. tins.

We feel confident in assuring our CUSTOMERS and the TRADING GENERAL that they will find our assortment of LAMPS and LAMP GLASS, as well as OILS and all kinds of BURNING MATERIALS, the most complete it has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms, and we are determined to fix our prices at a standard so low that dealers in the line of goods can lay in their Winter Stocks, and have a wider margin profit than they have ever had before.

STANFORD BROTHERS,

121, 123 and 125 California street,—Near Front.

VOL. IV.

SAN FRANCISCO, SATURDAY, DECEMBER 28, 1861.

NO 15.

Geographical Distribution of Silver Ores.

The great source of the silver of the world is the American continent, and its discovery brought about a complete revolution in the relative production of the precious metals and changed the whole aspect of commerce and prices. Previous, however, to the discovery of America, there were silver mines worked in Europe, which are still furnishing a quantity of the metal not entirely insignificant, and which have formerly been of great importance. Among the most interesting are those of Kongsberg, which will be first noticed.

NORWAY.—The celebrated mine of Kongsberg was discovered in 1623, and has been worked, with some interruptions, and with varying success, up to this time. The whole production of the Kongsberg mines, in silver, was:—

From 1624 to 1805, - - -	1,580,800 lbs. troy.
“ 1805 to 1815, - - -	25,460 “
“ 1815 to 1834, - - -	76,600 “
And in 1835, - - - - -	14,535 “
1836, - - - - -	20,924 “
1837, - - - - -	15,560 “

For the five years from 1849 to 1853, the average annual profits have been about \$160,000, the average production in that period being 16,971 lbs. per annum, and the total production 126,622 marks, or 84,857 lbs.

SAXONY AND BOHEMIA.—The chain of the Erzgebirge, which separates Saxony from Bohemia, extends for a distance of a hundred miles, in a direction from north fifty-five degrees west to south fifty-five degrees east. The elevation above the sea, of the highest points of this chain does not surpass five thousand feet. On both sides of the dividing line, mines have been wrought for many hundred years, which are not surpassed in interest by any in the world.

Freiberg is the principal mining centre; the number of veins in this district is about nine hundred; and many are pierced to a depth of one thousand feet and upwards.

The entire yield of silver from the mines of Freiberg District, from 1524 to 1850, was 5,611,900 lbs. troy.

AUSTRIAN EMPIRE.—This country produces more silver than any other in Europe, with the exception of Spain. The average annual yield of the different provinces of the Empire, from the period between 1843 and 1847, was 72,171 lbs. troy.

PERU AND BOLIVIA.—The silver mines of these countries, are considered next in interest and extent to those of Mexico.

Chevalier estimated the yield of Peru in silver in 1845, at a little over 300,000 lbs troy,—the yield from Bolivia amounting to 60,000 lbs.

CHILE.—This country contains several rich mines, the entire product from which, from 1810 to 1853, is estimated by Chevalier at 3,543,000 lbs.

MEXICO.—The silver mines of Mexico are admitted on all hands to be the richest in the world.

Chevalier estimates the whole amount produced by the Mexican mines, from the earliest period up to 1845, at the enormous amount of 162,858,700 lbs. Since 1845, the average annual yield has continued on the increase, and would

soon gain enormous proportions were it not for the unsettled political condition of the country.

UNITED STATES.—Until quite recently silver furnished by our country, came almost wholly from the native gold of California. Within the past two years, however, silver mines of great extent, some of them fabulously rich, have been discovered on the Eastern Slope of the Sierra Nevada chain of mountains. Those known as the Washoe mines were discovered first, and at the present time are being rapidly developed; other districts lying further south but along the same range of mountains are said to contain mines equally rich, but being further removed from the center of trade, and civilization, will undoubtedly require more time to gain the same notoriety, and advancement in development, than those first named.

It is altogether probable that the silver mines of Mexico are richer than those of Nevada Territory, yet owing to various causes, the yield from the latter in our judgement will soon throw in the shade those of Mexico, or indeed all mines in the world.

We could fill many pages with interesting matter pertaining to the silver mines of the world—of their discoveries, richness, peculiarities, &c., but our space forbids it present; we will often recur to the subject, our sympathies being peculiarly enlisted in the success and welfare of our mining interests, and deeming that any scrap of history throwing light on the subject of silver mining would at all times be interesting matter for our readers, as we can assure them it ever is to us.

Emigration to California.

“It is an ill wind that blows nobody good,” is an old saying which is frequently verified, and is already finding an exemplification in our national troubles. The war which is decimating Virginia and Missouri is giving strength and vigor to California, and will supply the seeds of a long enduring prosperity. For the past two months, overland emigration in that direction has enormously increased from all that portion of the West which fears the horrors of civil war, even as far as Kansas. All the roads leading to the plains are occupied with long trains of wagons, horses, mules, oxen and other essentials to life in their new home, owned by the very best sort of men for emigrants, who, with their wives and families, seek safety from robbery and personal violence. The interests of such men are all on the side of law and order; and finding all hope of their present restoration lost in one section, they go to seek another, carrying their means with them to enrich the soil upon which they next plant their feet. The women are worthy to be the wives of pioneers; they go armed with pistols and bow-knives, fearful of the attacks of savages, but ready to resist to the death in defense of their children and individual rights. From such progenitors California will raise sons and daughters who will shed a still brighter lustre on the diadem which encircles her brow.—*N. Y. Sunday Times.*

Tobacco.

A few days ago we saw several hundred pounds of Tobacco in town, which was raised by Mr. Stancell on Deer creek, in this county. It was of an elegant quality, and from appearance resembled the Virginia leaf very much.

Tulare Valley is the place to live. Here we can raise our own cotton, tobacco, sugar, molasses, and every thing else that is requisite to make a people prosperous, happy and comfortable.—*Tulare Post.*

Preparation of the Metallic Oxides.

The metallic oxides are variously prepared. Many metals absorb oxygen on being heated in presence of common air or oxygen gas, in the same way some of the lower oxides are made to combine with a further portion of oxygen. The protoxide of manganese MnO heated in contact with air is converted into sesquioxide Mn₂O₃. The protoxide of barium (baryta), heated to a temperature of about 700° Fnh. in an atmosphere of oxygen, absorbs another equivalent of the gas; but if the temperature be elevated much above this point, protoxide of barium is again formed.

By exposure to heat many of the higher oxides lose a portion of their oxygen. The peroxide of lead PbO₂, and the sesquioxides of nickel and cobalt Ni₂O₃ and Co₂O₃, are by this means converted into the protoxide PbO, NiO, and CoO. On this fact also depends one of the most common methods of making oxygen; as, when the peroxide of manganese MnO₂ is heated to redness, it gives off a part of its combined gas, and leaves the sesquioxide of manganese Mn₂O₃ in the retort.

The oxides of some of the metals, such as those of antimony, arsenic, and tellurium, may be thrown into a red-hot crucible, and treated with a solution of potash, this salt will be decomposed with the formation of antimoniate of potash, which, on being decomposed by an acid, deposits antimonic acid Sb₂O₃. In the same way, by fusing oxide of chromium with nitre, chromate of potash is obtained, from which the chromic acid CrO₃ is readily separated by the addition of sulphuric acid.

Many of the higher oxides are obtained by heating either the metal or a lower oxide with nitric acid, and then evaporating to dryness. Some of the metals, such as tin and antimony, leave an insoluble peroxide in a free state when thus treated. Others, and these are by far the greater number, form nitrates, which, on being heated to redness, are decomposed, and a metallic peroxide is left.

All the carbonates, except those of the metals of the first group, are decomposed at high temperatures, giving rise to the evolution of gaseous carbonic acid, and the production of a free oxide. In this way, lime, barytes, and strontia are obtained, by calcining their respective carbonates; and the carbonate of lead, similarly treated, will be found to yield its carbonic acid with still greater facility.

When heated to redness in a current of hydrogen gas, many of the higher oxides are reduced to the metallic state; others are merely converted into protoxides, and resist all further efforts at reduction by this means.

The metallic oxides can frequently be prepared by precipitation from their salts, through the medium of an alkaline base, or ammonia. If we pour caustic potash into a solution of proto-sulphate of iron, a precipitate of hydrated protoxide of iron will be obtained. The following equation will explain the reaction:—

$FeO, SO_3 \times KO, HO = KO, SO_3 \times FeO, HO$
If the protochloride of iron were employed, the reaction would be as follows:—

$FeCl \times KO, HO = KCl \times FeO, HO$
The same reagent produces in solutions of the sesquioxide the following changes:—
 $Fe_2O_3, 3SO_3 \times 3KO, HO = 3(KO, SO_3) \times Fe_2O_3, HO$
 $Fe_2Cl_3 \times 3KO, HO = 3(KCl) \times Fe_2O_3, HO$

Here the protoxide of iron is replaced by the sesquioxide contained in the salt, which like the former is precipitated in a hydrated state. On heating the hydrated protoxide of iron, the water is expelled, and, from the absorption of oxygen, anhydrous sesquioxide of iron results.

The peroxide of hydrogen is sometimes employed for the oxidation of those bases which resist less energetic means, and in this way the peroxide of calcium, and some other peroxides, are obtained.

Mines in Sonora.

Various works have been written concerning the mines of Sonora, and most of them agree as to the extent, immense richness, and the causes of their decadence. None of these writers, however, whether from want of time or reliable data, have treated the subject with the attention that it merits. The statements which follow may be relied upon as accurate, being based upon authentic information from the owners and directors of mines, and careful personal observation.

We may safely say that the mines of Sonora are almost unknown in the other States of the Republic, and even in the metropolis; it is known, indeed, that such a country as Sonora exists, and that it is rich in minerals; but this knowledge is about as definite as that generally possessed with regard to Siberia and Southern Africa—derived from the vague accounts that we have read of those countries. This general ignorance, and consequent indifference, together with the lack of the protection and assistance of the Government, have caused a sad decay of our mining interests, and they now retain but a shadow of their former prosperity.

Up to the year 1810, the silver mining establishments continued in a flourishing condition. Quicksilver was then supplied by the respective Territorial deputations to the registered miners, upon a credit of six months, upon their personal security, at a price that never exceeded sixty dollars, and frequently fell to fifty-seven dollars per quintal.

"Gambucinos," viz: those miners who, without capital or assistance, worked either in abandoned mines or in those too poor to tempt capital, were of great benefit to the community; since, being numerous, the aggregate of their labors amounted to a considerable sum. But when the price of quicksilver rose to one hundred dollars, and finally to one hundred and seventy dollars per quintal, a general decline of the mining interests was the result. The gambucinos, among others, were forced to abandon their labors, and this materially impeded the discovery of new mines. Many of them turned their attention to gold mining, which does not require so large a consumption of quicksilver, and made important discoveries of this metal, as we shall hereafter relate.

The mines in Sonora have been worked from time immemorial, as proved by the number of excavations discovered by the first settlers after the conquest, and of which we have no more authentic information than that derived from tradition. On the Cerro Prieto, between the rancho de la Palum and la Cara Pintada, is an old mine called Tarasca, that has not been worked for more than one hundred years, and that was, according to tradition, exceedingly rich. In the neighborhood of this mine, in the neighborhood of

one celebrated for its richness, was discovered by a Catalan Spaniard, named Juan Jose Carumina. When abandoned by the original discoverer it was full of water. Carumina succeeded in clearing it for two or three hours, and took out a lump of ore weighing three arrobas, (75 pounds) which yielded fourteen marks (112 ozs.) of pure silver. Unfortunately, at this time he had the misfortune to break his baling apparatus, and the water rushed in so rapidly as to refill the mine in six or seven hours. Carumina, having expended all of his capital and contracted several debts, was compelled to abandon the undertaking, and repaired to Chihuahua. A company afterwards attempted to work the mine; but after having expended a considerable sum, they abandoned it on account of a fatal accident to one of the workmen.

Most of these old mines, according to tradition, were exceedingly rich. Some of the old inhabitants of San Jose de Gracia, in speaking of the mine of Carumina, testify that the vein in many places was of virgin silver, and that in others the ore yielded fifty per cent. of pure silver; also, that there was a stratum of red earth that yielded great quantities of gold—they having frequently witnessed the extraction of two and three hundred marks on one single occasion. The depth of this mine exceeds one hundred varas, and those of San Juan de Sonora are said to be equally deep. It is by no means surprising that these mines should have been abandoned by their original proprietors, considering their limited knowledge of mineralogy, and the insufficiency of their means to enable them to overcome serious obstacles.

In the work entitled "Apostolic Labors of the Society of Jesus," published by one of the members of that order, is the following statement: "In the year 1769 a region of virgin silver was discovered on the frontier of the Apaches, at the place called Arizona, on a mountain ridge about half a league in extent. The discovery was made by a Yaqui Indian, who revealed it to a trader, and the latter made it public. The news of such surprising wealth attracted a multitude to the spot. At a depth of a few varas, masses of pure silver were found, of a globular form, and of one or two arrobas in weight. Several pieces were taken out weighing upwards of twenty arrobas; and one found by a person from Guadalupe weighed one hundred and forty arrobas. Many persons amassed large sums, whilst others found nothing."

This discovery is mentioned, not only in the work referred to, but in "Los Ochos Espanoles," and in documents existing in the archives of the missions of Pimeria Alta. Later, in the year 1817, Dionisio Robles, an inhabitant of the town of Rayon, fitted out an expedition of two hundred men, and

proceeded to Arizona for the purpose of exploring this mine. They examined the spot, making several excavations; but although indications of virgin silver were plentiful, they found but a few grains and one small lump, weighing five marks—seven and one-fourth ounces. As, however, they remained in that region but eight days, when they were compelled to return on account of the Apaches, their want of success is not to be wondered at; and from the previous statements there can be no doubt of the existence of enormous deposits of silver in Arizona.

History and tradition agree as to the discovery of this mine and its subsequent abandonment. They both state that in the year of the discovery—1769—the military commander of the presidio of Altar seized the larger masses of silver as being the property of the crown; that the parties interested protested against this, and not obtaining redress, appealed to the audience chamber of Guadalajara, which referred the matter to the court of Madrid. At the end of seven years the king declared that the silver pertained to his royal patrimony, and that the mine should be worked for his benefit. This decree, together with the attacks of the hostile Indians, caused the abandonment of the mine, which has continued to the present day. The members of the expedition of Robles unanimously agreed that the entire region was rich in minerals, and that to the east of the scene of their explorations lay a mountain range containing numerous veins of gold and silver, crossing each other in all directions. Don Teodoro Salazar, a man of veracity and great practical experience in mining, confirms this statement; and adds that the earth seems to invite the hand of man to develop the enormous mineral wealth contained in its bosom.

The annexed engraving is an excellent picture of a beautiful building lately completed, on Stockton street, and owned by Messrs. John & Edward Ryan.

The upper stories are occupied as a dwelling, while the ground floor and basement are used as a livery stable—one of the largest and grandest establishments in the State.

The total space devoted to this purpose is as follows: 2 rooms, 1 hundred and forty-two feet by forty-seven; and 3 rooms, fifty-eight by twenty-two feet. The business done by the enterprising owners must be immense, as will be readily concluded by any one paying them a visit.

Their stock of horses is large and A No. one, while the number of buggies and carriages owned by them exceeds fifty in number.

Our readers should make a note of this information, and whenever in want of a good turn out, not fail and call on the energetic and enterprising Ryan, Brothers, on Stockton street.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

Mining Companies and Associations.

Office Dios Padre Gold and Silver Mining Company, 215 Front street, San Francisco, September 29, 1861.—Notice is hereby given that an assessment of one dollar per share on the capital stock of this company, was levied this day to be paid in installments at the office of the company as follows: Twenty-five cents per share, on or before the 29th inst.; twenty-five cents per share on or before the 29th October proximo, and fifty cents per share, on or before the 28th of Nov., 1861.

Shareholders will take notice that delinquent stock will be proceeded against in strict conformity to law.
By order of the Board of Trustees.
JOS. P. NOURSE, Sec'y.

Office St. Louis Gold and Silver Mining Company.—Notice is hereby given that the Board of Trustees of the St. Louis Gold and Silver Mining Company have, this 15th day of October, 1861, levied an assessment (for completing their mill) of two dollars upon each share of the capital stock of said company, payable to the Secretary, at No. 40, Montgomery Block, San Francisco, by order of the Board of Trustees.
J. H. BREWER, Secretary.

Office of the Cule Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cule Silver Mining Company held Oct. 25th, 1861, an assessment was levied of one-fourth of one per cent on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.
By order of the Board of Trustees.
J. B. COFFIN, Sec'y.

Office Dios Padre Gold and Silver Mining Company, 215 Front street, San Francisco, October 29th, 1861.—A meeting of the stockholders of the Dios Padre Gold and Silver Mining Company, held at the office of the company, on Saturday, November 10th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.
JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.
By order of the Board of Trustees.
JOSE F. LIGHTNER, Secretary.

Office Gould and Curry Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.
JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which he made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.
C. S. HIGGINS, Secretary.

Office Crown Point Gold and Silver Mining Company, 321 Front st., San Francisco, Oct. 25th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 29th, at one o'clock P. M.
O. B. CRARY, President.

Office Norman Silver Mining Company.—Notice is hereby given to all stockholders in the Norman Silver Mining Company, that an assessment of fifty cents upon each share of the capital stock of said company was duly levied on the 5th day of November, 1861, and is payable on or before the 10th day of December, 1861, to Chas. Lindington, at Virginia City, N. T., or to the Secretary of the company, at No. 40 Montgomery Block, San Francisco.
By order of Board of Trustees.
J. H. BREWER, Sec'y.

Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 10th of December next, at the office, as above.
J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining Company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 25th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City; or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.
By order of the Board of Trustees of S. N. S. M. Co.
J. H. BREWER, Secretary.

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.
All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.
JOSH. S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty-sixty or ninety days from date, to the Treasurer of the company.
By order of the Board of Trustees.
JOSH. S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.
By order of the Board of Trustees.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the person of David C. Lawrence, Esq., a member of the Supreme Court, but, who also fills the office of clerk in the Patent Office over several years, and in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

The Past and Future of San Francisco.

Those of our readers who visited San Francisco as early as 1851, all well recollect the barren and desolate appearance of that part of the city lying south of Market street. Sand hills of various altitudes covered the country all the way to Mission creek. Every thoroughfare the pedestrian might attempt to travel was covered with sand ankle deep; but now behold the change a few years have wrought. What was then a waste and dreary to behold is now a hive of industry, and the most beautiful part of our city. The sand hills took their exit into the bay; manufactories, churches, and handsome residences have taken their place. The streets are now planked or macadamized, and instead of beholding 'stunted chapperell, the most rare and beautiful shrubbery surrounds and adorns nearly every dwelling. But great as the change wrought in that part of the city, it is equally great in other sections, until the whole area from North Beach to Mission creek, and from Long Wharf to the Willows, is almost one continuous mass of buildings.

A person with ordinary foresight might have foreseen all this, and with a paltry sum have possessed himself of property, which at the present day would realize him a large fortune. But those early times in California were "exciting days;" we all sought to become rich in a day or a year at the furthest. Most of us were extremely short sighted. We were intoxicated with excitement; ambition blunted our reasoning faculties; few of us would stop to think; our

usual caution had left us. The city had no attractions for us; we all must go to the mines in search of the glittering ore, many of us dreaming we should find a place richer than any ever found, a sort of fountain head, from whence all the gold originally came! but alas, what disappointment! our dreams were never realized. Thousands of our early miners are here now, poor, and without energy, many almost heart-broken and undone for life.

Every portion of our State was rich; many localities have yielded untold wealth; and yet the very same localities are now almost deserted, and the denizens who yet remain, as a general thing, are not over stocked with this world's goods. On the other hand, nearly all classes in our city are continually gaining in wealth, and capital is becoming extremely abundant.

The fact is San Francisco has had a monopoly over every other class of residents in the State. We speculate on imports and exports, not only for the use of our own State, but we might almost say for the whole Pacific coast. This monopoly we ever will have, and just in proportion as the trade and population increases, so will our profits and prosperity increase.

So much of the past, now what of the future? We imagine a little reflection and use of good judgement might enable most any person to make a tolerable good guess. A little foresight ought to enable the most skeptical to make correct calculations as to our future greatness.

It is well known to most of our readers that since the difficulties in the East, thousands have here sought an asylum. The influx and addition to our population is monthly counted by thousands, while at the same time the departures are few. Undoubtedly a few thousand of our hardy miners will leave our shore for a short time in order to explore lately discovered gold fields in the north, but their necessities will nevertheless in a great measure be supplied by our merchants. Our hotel keepers derive profit during their stay in the city, and our steamboat owners from their travel hither and thither.

But this is taking only a narrow view of the subject, and did we wish to extend this article we might give our imagination a wider scope, by taking into consideration the fact, that San Francisco is on the air line between China and the great marts of trade in the East, speculate on the probable time when this trade will go by our very doors. We might also speak of the increase in manufacturing interests, the increase of gold and silver extracted from our mines, of our facilities for ship building, which, ere long must become profitable on our coast besides a great many other matters all bearing on the subject, and overwhelming proof that our trade is only in its infancy, and the city of San Francisco but entering its destined career of prosperity and greatness.

The man of foresight can on every hand find abundant proof of this fact, and we trust many may be found in our midst who will take advantage of this knowledge, and make hay while the sun shines.

Esmeralda.

Under date of Dec. 18th, a friend at Aurora writes as follows:

Times just at present are dull. Many of our miners have concluded to spend the holidays west of the mountains, and have taken their departure for a short season.

New discoveries here are almost an every day occurrence. Rock assaying two thousand dollars per ton, has been struck in the Golden King lode, besides many other discoveries too numerous to mention. I am no prophet nor son of a prophet, but I will say this much concerning our mines, they are the richest ever found, and in less than two years from now will astonish the world. The country is fit for nothing else, and I think would never have been created only that the moulders of the earth had an overplus of metal on hand and no other place to put it, so they made Esmeralda. They put it where it would puzzle all mankind to find it, and after being found cost as much as possible to take it out.

Travel Northward.

Although the year would indicate that winter in those parts of the world where the term applies, had but just set in, yet already are hundreds of our roving disposed population setting their faces northward, on their way towards

those cold and inhospitable regions known as Cariboo and Nez Perces.

Unless we are incorrectly informed, the beginning of March is plenty early enough to leave San Francisco. Everyone going now must expect to winter or lie over some place ere reaching the mines, and necessarily will be subjected to a much heavier expense for subsistence, than were he to remain in San Francisco or vicinity: besides if it is certain that the mines cannot now be reached, a prudent man would naturally want to improve the several months intervening, by employing himself usefully and profitably ere taking up his march.

But as things in California go pretty much by extremes, so in this case we presume no preaching of ours will have any influence in the matter.

However as we charge nothing for any benefit that may accrue by listening to our advice, we presume no one will object if we take this occasion to caution all persons intending to go north, against starting now, when beginning of March or April is full as early as access can be had to the mining region.

Live Yankee Quartz Lode.

Among the great number of rich quartz veins in the Esmeralda District; not one of them all prospects equally rich in gold to this lode. It is situated on Middle Hill, and was discovered and claimed on the 20th of Sept., 1860. Little work, however, was done to it until July 1861; at which time a shaft was commenced, out of which, from very near the surface, rock was taken which assayed \$5,000 to the ton, mostly in free gold. The writer of this has seen an ounce of rock pulverized which yielded three dollars in gold, and many pieces of rock apparently were even richer than this.

The company perfected their incorporation in September last, with a capital stock of \$120,000 in shares of one hundred dollars each.

Most undoubtedly the vein is equal in richness to the famed Gold Hill mines, which at present sells at \$3000 or upwards per foot, while Live Yankee hardly commands thirty dollars.

But we venture to say the time is nearly at hand when the real worth of gold and silver mines will be better understood, and when Live Yankee stock will command prices equal to Gold Hill.

Native Wine.

The Manufacture of wine has already become a business of much importance in our State. The wine made here is of a very fair quality, and finds ready sale throughout the length and breadth of the State. We are pleased to note this fact, as its large consumption will correspondingly decrease the sale of the poisonous liquors heretofore sold and drank so unsparingly.

We sincerely trust that strychnine whisky has had its day—that no more fifty cents per gallon liquors will find sale while wines are so cheap.

When our wishes become true, we may as a matter of course look for a reduction in the price of camphene.

Important Notice from the Post Office Department.

The following important notice has been issued by the Postoffice Department.

POSTOFFICE DEPARTMENT. }
November 26, 1861. }

In view of the increased number of letters held for postage and returned to the dead letter office, it is ordered that the order of this department dated 8th October, 1860, be rescinded, and the prior practice be restored: Postmasters will, therefore, notify the person addressed that such letter is held for postage, and that upon his writing therefor, prepaying the postage on his letter and enclosing a stamp to be placed on the letter held for postage, the same will be forwarded to his address.

By order of the Postmaster-General.

J. A. KASSON, Assistant P. M. G.

Sale of Mining Interest.

The Silver Age of a late date says: Governor Nye and others a week or two since, purchased the remaining interest of Col. Vibbard, in the Esmeralda District, for the sum of \$25,000.

SUMMARY OF MINING NEWS.

To Miners and Mill Owners.

We respectfully request all persons interested in the Mines, Quartz Mills, or in any prospecting expedition; also the owners of the different mining districts to forward to us all the information concerning the condition of the mines and hills in their vicinity, and description of localities, as they may think will prove interesting or useful to public, for publication. Records of mining districts will be sent by mail to their address.

CALIFORNIA.

Our mining news culled from exchanges in the interior are extremely scarce this week. The late floods have undoubtedly done much injury to the mining interests of the State. Newspapers are filled with accounts of the same. Up to the time of writing we have looked in vain for a record of a big strike or anything whatever indicating the existence of mines in the interior.

Amador County.

This county taken from territory belonging to Calaveras and El Dorado, was organized in 1854. At present no county in the State, taken as a whole, is more prosperous. The people have ever been fortunate in the selection of their officials. Taxes are paid promptly, and although the county had to assume a portion of the indebtedness of Calaveras, their share amounting to a large sum, besides being subject to a heavy outlay for erecting county buildings, yet are now we believe entirely out of debt.

The placer mines embraced in the territory composing Amador have been, and are to the present day, paying remunerative compensation. Some of the best were of course richer than others. Among the placers early located we may mention Dry Creek, in the vicinity of Dry Town. Here a number of miners commenced operations as early as 1851, and were rewarded handsomely. Many of the number realizing their piles and looking no further, sought their homes in the East.

The vicinity of Jackson also afforded excellent diggings. We recollect a number of persons, who as early as 51 and 52, deemed themselves possessed of a competency, and left the stage of action for their peaceful homes far away. Butte city and Clinton were localities rich in the precious metals, but as water was scarce until 1856, were not worked as extensively in early times as some other localities.

Placer was discovered it is said, by soldiers composed of an expedition sent the Indians. The character of these mines was different to that of the portions of the county, the diggings being deeper and the pay dirt lying in strata, found from the surface down. In many places the bed rock never been struck, it being a limestone formation, similar to the diggings at Murphy's Camp, and near Columbia.

The richest pay was found immediately where the town stands, but for a full mile to drain the ground, and to run away refuse earth, were not tried until a late day, and after a cut had been made up Sutter creek, high solid rock of great depth and hundreds of yards in length. (About the last year or two very rich quartz lodes have been struck in the vicinity of Volcano, which will ever be a source of profit to those engaged in working them, as well as the community generally.)

Other localities such as Lancha Plana, Rancharie, Fiddletown and Fort Bidwell, have ever since their first discovery, paid handsomely, but our space forbids us noticing them at length. Quartz mining in the vicinity of Sutter and Amador is carried on quite extensively. Many of these engaged originally commenced with a small capital have now become wealthy. In instance we will mention Alvira Hayward, Esq. This gentleman engaged in this business at Sutter creek, in the year 52 or 53. His means were limited, but being possessed of indomitable energy, besides bringing play good judgment; not being above work himself, and working to advantage, has persevered through fair weather and foul, until at the present day he counts his wealth by hundreds of thousands. His mine is large shaft from which the rock is taken is five hundred feet in depth. The rock at that depth is thirty feet thick, and paying an average of about five dollars per ton. His mills situated near the mine are driven by water, and contain eighty-six stamps, which crush about one ton to the every twenty-four hours. The works employ about ninety hands, the profits are said to exceed \$12,000.

Other lodes in the vicinity pay equally well, and altogether no section of the State is more prosperous or contributes more largely and steadily of precious metals than the vicinity of Sutter creek and Amador city.

Besides the mining interests there are others all aiding to make the people prosperous. A person might travel over the whole State of California, find no more beautiful valleys than those known as Lone, Jackson, and Greek. The land is extremely fertile. The crops raised on some of the land in Jackson valley are almost beyond belief. Coal has also been found in Lone city, and still further north, towards the northwest corner of the State.

The timber in the mountains east of Volcano and Fiddletown is very abundant, and of the best quality, but as little market is yet found, the trees are almost untouched.

No necessities are requisite for the future welfare of Amador county, and no what we have learned quite lately, are likely soon to be carried out. We have reference to the building of a wagon road across the Sierra Nevada, and a railway communication with Sacramento. The former is a necessity, the latter would be a benefit of no mean importance. Let the people of Amador bestir themselves; their future welfare require these improvements, and every permanent resident should exert himself to have them carried out, and completed at an early day.

Mariposa County.

Our travelling correspondent writing from Coulterville, December 21, writes that the mines in this part of the county as a general thing are exceedingly good. Good pay is found in many of the creeks in this vicinity. Some companies own claims which are held as high as \$1500.

The Goodwin Brothers, owners of a lode have erected a small mill during the past season. From four stamps of a fifteen days' run was fifty pounds of gold. Messrs. Martin & Walling, Scott & Co., and several other parties

among others, will commence operations in the spring, when times in this section will undoubtedly improve and labor be in demand.

The Mariposa Gazette says: The machinery for a new quartz mill of fifteen stamps, to be erected at Coulterville, was landed at Stockton on the 6th inst. It is the property of Mr. J. Finet.

Sierra county.—The editor of the Mountain Messenger says: We paid a hurried visit to Howland Flat last week, via St. Louis and Pine Grove, getting back just in time to make a report of it in the Messenger. We saw the old mine of the Iowa East company, we visited the Union claims in the evening, going safely through on the underground railroad, thanks to the polite foreman and our worthy guide. After prowling about from tunnel to shutes and breasts, at an angle of forty-five degrees, began to get tired of the fun and blow our stars with the blow it was about through with; but alas, the half had not been shown us, and our faithful guide still led us round from place, where honest miners burn the midnight candle, showing specimens of swelled rock, which in some places had broken or shattered the big substantial timber, with which the most of the tunneling of this company is finished up, and letting us out into daylight at moonlight at about ten o'clock, after a confinement of two hours and a half. We were about to peep and sing out "enough," when our guide announced us in the "homeward-bound" stretch, and we blessed him mentally but said nothing. From what we saw we judge that the owners of these claims well deserve the good luck they are in for their perseverance and hard labor in developing their richness. We saw several games of all-fours' passing through the breasts of the big banded breasts (heard something several times which sounded like a suppressed snicker) and got out on good humor with ourselves and our friends. The company were working fifty hands ten or twelve weeks, and had cleared up over twenty-five thousand dollars, with the prospect of finishing up the washing with about six thousand dollars more. In the morning we made a hurried tour of Down East, Shirley and Mountbain, in which last place we found our friend Sam Holliman. Considering the small cost of working the Iowa East and Shirley, we saw that they are at present about the best paying claims at the Flat, though there are others which will not pay much longer. These two claims pay about six. The Down East work ten men, claim up weekly and average about six hundred dollars a week through the season. All the claims are said to be doing well, and if confident faces and the busy air of the people are any index, it must be so. In the Mountbain we noticed, imbedded with the gravel and rocks, the bodies of large trees gone to decay. The curl and grain of the wood were still to be seen, distinctly as in well burned charcoal. Here, buried hundreds of feet below the surface of the earth, they must have lain for centuries—perhaps for thousand of years—slowly gathering the moss of ages and mouldering to decay. Greenleaf & McMillan are keeping the Sierra House set a table of substantial fare, and are extensively appreciated. Our friend McNece has our thanks for many favors.

Tulare county.—We take the following extracts from the late Visalia papers: The bella says: Never, it seems to us, since the settlement of this valley, have the prospects of a sure recompense for labor expended in farming, been so good as they are for the coming season. The rapid development of the mineral wealth in the Cozo, Telescope and other silver districts, afford a certain assurance of the accumulation there, during the next summer, of a large population; and if common sense and a little energy prevail, in the way of road making, the miners there must receive their supplies from this valley. The Kern and White river quartz mines too are yielding well, and the population of that section is steadily increasing. The troubles in the old States will drive thousands of sturdy emigrants, mostly farmers of Virginia and the southwest, to seek an asylum within our peaceful borders. Most of these will settle in the unoccupied Government land in this section, and must be fed until they can raise a crop. These facts are sufficient we think without any elaborate argument, to convince farmers that four times the amount of wheat grown last season will not be any too much, in view of the increased demand. Other branches of farming, too, will prove very remunerative. Butter, cheese, honey, lard, eggs, etc., will from this time forth, command, as they do now, good prices; and there will be little excuse if the farmers are not out of debt by this time next year.

HYDRAULIC CEMENT NEAR MARTINEZ.—We understand that a vein of good hydraulic cement has been discovered near Martinez, that it has been suitably tested and found to be a good article. It is of the same character with that of Benicia, which has already been brought into general use and is competing successfully with the best of eastern cement. A couple of gentlemen have bought the land, and are making preparations to introduce this cement for sale into the general markets of our State. Success attend them.—[Contra Costa Gazette.]

San Bernardino County.—According to the San Bernardino Patriot, coal of a superior quality, and abundance, of great purity, have been found on the Santa Ana river, in San Bernardino County. Gold, silver and copper have been found in promising richness along the Mojave, at different points. The resources of Southern California have yet to be developed.

Trinity county.—The Trinity Journal says new diggings are being struck in gulches never before worked. On Line Kilm Gulch, near the Forest House, Mr. Handy picked up from the surface of the ground a piece of gold weighing eleven dollars. A large amount of ground has been sluiced out of the gulch by the late storms. Several persons are staking out claims.

Tuolumne county.—The Sonoma Democrat says, a big chunk of gold and quartz weighing four pounds, and containing three pounds of pure gold, was taken out of the Smith & Tindler claim, in the upper end of Sonoma on Friday morning. Six hundred dollars besides this were taken out the same day.

Nevada county.—Watt & Co., of Massachusetts Hill, Grass Valley cleaned up last Saturday, the product of ten days run, 2400 ounces, valued at \$40,000. These claims are probably among the richest in the State.—[Cal. Express.]

NEZ PERCES MINES.

We learn from Mr. R. Canfield, who arrived here on the Julia on Monday night, from Oro Fino City, that very little mining is being carried on in that neighborhood, as nearly all the miners in that section have gone to Salmon river. Mr. Canfield places the number now remaining at one hundred and fifty. He says the snow is nearly two feet deep, and extends only some twelve miles from Oro Fino city, where it suddenly ceases, and from thence to Walla Walla he found very little snow. Lewistown was not visited by any this season. Previous years are plenty, and a large number of Salmon river miners have come to Oro Fino for supplies, being more convenient than Walla Walla.—[Portland Advertiser.]

In the columns of the same paper we find the following letter:

NEVADA CITY, Nov. 25th, 1861.

EN. ADVERTISER.—Besieged by the rude blasts of winter, and surrounded by the fast accumulating snow, there is little to be done or seen in this high locality. Most of our time is taken up in discussing the war, in reading the obituary notices and the more refined accomplishments of the day, and in drinking. From such amusements I have taken brief respite, to inform the readers of the Advertiser what is going on in the way of mining and prospecting, the prices of provisions, &c. Now for the present in this immediate neighborhood, mining is entirely abandoned. For the last three or four days I have not seen a single man to work, and I consider it almost impossible from the amount of snow here now (over four feet) and accompanied by the coldest of winds; but although they cannot work they are busy in prospecting on and beyond Salmon river. Mr. Canfield and Mr. Canfield being on the 21st. They gave good reports, when a large number left for there. They say they have seen men taking out from two to six ounces a day. But I am satisfied to stay and hold on to my claim till spring. Yet near me are just as good claims, the owners of which have started for the new mines. "I could take up" of the amount of gold taken out in many of the claims here, which would sound almost fabulous.

Other claims, and as good apparently, pay but indifferently. All is chance with the miner, so far as the richness of his claim is concerned. I do not anticipate to be able to work my claim to any advantage before next April, but my kind and anxious friends are scarce and dear. Sugar, bacon, beans and coffee, are not for sale. Of flour there is a quantity but inferior quality and enormous prices.

HUMBOLDT MINES.

The following letter describing the above named mines, was sent in a late number of the Mountain Messenger.

ANDERSON CREEK, Nov. 20th, 1861.

Friend Dewey—I arrived at my destination in the Humboldt mines on the last day of October, and am well pleased—I may say delighted—with the country; and thinking that a description of the mines will be interesting to you, I will attempt to give as good an illustration of them as my limited stock of information will allow. The extent of the silver mines already prospected is thirty miles in length, and about ten in width, extending along a range of mountains running north and south; and I think from what I have seen, that the silver lodes many of them are equal to the famous Omatcoke lode at Virginia. About four hundred men are in the mines at present, most of whom will winter here. There are three towns already started. Humboldt City, which is at present the largest place, is situated at the north end of the range, about twelve miles from the Humboldt river. Star is situated about ten miles south of Humboldt city, and is a place of considerable trade already. Reno or Uniontown, the county seat of Humboldt, is located eight miles, has fine water privileges, and being near the center of the richest silver mines in the world, it is destined at no distant day to be one of the principal cities of the Territory. The National ledge at Uniontown, assays upwards of \$1700 to the ton, in gold, besides a fine yield in silver. Anderson creek is four miles from Uniontown. There is but one canyon the creek besides ours, and we have not yet got down the place with the name of town; but we have some very fine silver lodes here, and several of them. We also have some fine water privileges, and it will not be long before we will have a nice little town of our own. Timber is quite scarce in the mines, although there is an abundance for fuel, and always will be, there being any amount of scrub cedar in the mountains. Good lumber for building purposes may be found on the range of mountains lying east of Humboldt mountains, some twenty-five miles distant. The silver and gold lodes, thus far, have been worked by arrastras. Several quartz mills will be erected in the spring. We have very fine water. Many persons in your State are of the opinion that this element is poor here, but I assure you that the water is equal to that of the California mountains; but the liquid in the Humboldt river is miserable, which every one is aware of who knows anything about it. The climate we know but little about. For the first ten days it was warm and pleasant, but for the last week it has been snowing, and on every day yet the snow is only about ten inches deep. I am of the opinion that the climate is unusual one at this season of the year. From what I can learn the climate is somewhat similar to that of Nevada, California. The nearest and best route from here to California is by way of Truckee river, Beckwourth Valley, Jamison creek and La Porte. If the citizens of La Porte, Gosherville and Whiskey Diggins would improve this route early in the spring, the travel would in a short period repay them for their trouble. Nature has given them every advantage, and if they do not improve it, they will never prosper. What few Indians we have seen appear peaceable and friendly. I hope they will remain so and keep away from us. The farther off they are the better I like them. Should they become troublesome, however, and disposed to quarrel with us, we are well prepared to defend ourselves, as we have plenty of arms and ammunition.

NEVADA TERRITORY.

It appears that our extensive coal fields are about to be put to use. We understand the Phoenix mill, at Silver City, will run with coal after Christmas. The coal will be supplied from the Whitman vein, and it is calculated they will be able to furnish two other mills with the necessary fuel. If coal should be found to answer the purpose as well as wood, the opening of the newly discovered veins will be an important era in the history of our Territory.

OREGON.

A piece of gold quartz, weighing twelve pounds was taken from the celebrated Applegate lode, Oregon, a short time since, and yielded nine hundred and ten dollars. Tons of quartz from the same lode have paid nearly as well. Specimens taken from leads for exhibition universally show well, but the leads generally fail.

Mining Companies and Associations.

Office of the Sucker Gold and Silver Mining Company, Nos. 1 and 2, Montgomery Block, San Francisco, California.—Notice is hereby given that the annual meeting of the Stockholders of the Sucker Gold and Silver Mining Co., will be held at the office of the Company, Nos. 1 and 2 Montgomery Block, on the first Monday after the first Tuesday of January, A. D. 1862, at ten o'clock A. M. of that day, for the election of Trustees, and for the transaction of other business.

By order of the Trustees.

R. H. WALLER, Secretary.

Office Sierra Silver Mining Company.—At the Annual Meeting of the Stockholders, held Monday evening, December 9th, 1861, the following gentlemen were elected Trustees to serve for the ensuing year: H. Culver, Daniel Norcross, F. D. Conroy, Jason Clapp, Calvin Taylor, R. R. Noblitt, T. J. Furber, Isaac Tabor, E. Baker, Henry Palmer.

DANIEL NORCROSS, Sec'y. S.S.M. Co.

69. At a meeting of the Board of Trustees, held Thursday evening, Dec. 12, 1861, the following officers were elected to serve for the ensuing year.

F. D. CONROY, President.

W. H. CULVER, Treasurer.

DANIEL NORCROSS, Secretary.

D. NORCROSS Sec'y.

69. At a meeting of the Board of Trustees, held Thursday evening, Dec. 12, 1861, an assessment of \$1 per share was levied, payable at the office of the Secretary.

D. NORCROSS, Sec'y.

144 Sacramento street.

Office of the (Ruas District) Union Gold and Silver Mining Company, San Francisco, Dec. 13th, 1861.—The stockholders are hereby notified that an assessment of ten cents per share on the capital stock of the Union Gold and Silver Mining Company was levied on the 12th inst., payable on or before the 15th of January, 1862, at the office of the company, 410 Montgomery street.

By order of the Board.

C. J. HIGGINS, Sec'y.

Notice is hereby given that an assessment of One Dollar per foot (share) has this day been levied on the ground of the Albamara Mining company, payable at the office of the company, 815 Sansome street, San Francisco.

By order of the Trustees.

J. O. STRAUCH, Secretary.

November 24th, 1861.

Notice.—The annual meeting of the Charles Cany mining company, will be held at the office of the company (D. Davidson's room, northeast corner of California and Montgomery street, San Francisco) on Friday Dec. 27th, A. D. 1861, at 3 o'clock P. M. of that day, for the election of officers for the ensuing year, and transaction of such other business as may be presented. A punctual attendance of all stockholders is requested.

By order of the Board.

ALEX. FLY, President.

Quartz.

Continued.

Capped Quartz.—This is a most interesting variety of crystallized quartz, whose peculiarity, as its name implies, arises from the summit of the crystal being capped by a larger crystal fitting closely upon it. The Planes of the inner crystal are dull, and not polished like those of the outer. It is found in Cornwall.

The following are the principal varieties in which Quartz, when not crystallized, occurs:

Amethystine consists of Quartz rock enclosing minute particles of Mica often of a golden hue, and, when polished, presenting a beautiful spangled appearance. The finest specimens, of the red variety are from Spain, though these are said to be equalled by those found at Glen Feraut in Scotland, which are of a bluish-grey color. It is by no means a common mineral.

Prase consists of dark green Actinolite enclosed in Quartz. It has been found in Scotland.

Cat's Eye.—This mineral, which is considerably valued, when cut and polished, as an ornamental stone, consists mainly of Quartz, but its beauty is owing to the fine silky fibres of Asbestos traversing it, presenting an appearance similar to the eye of a cat, whence its name. It is brought from Ceylon and from Malabar.

Hyalite is a glassy variety of Quartz occurring in a botryoidal form on trap or basaltic rock, the cavities in which are sometimes partially filled with this interesting mineral. It is occasionally tinged with a pale buff-color, giving an appearance like gum arabic. From Mexico and Hungary are procured the finest specimens of Hyalite, which also occurs in the United States.

Rose Quartz.—So called in allusion to its delicate pink colour, which can only be compared to the "pure and holy blush of maiden modesty." This color, supposed to be derived from Manganese, has been taken advantage of by the dishonest, and the stone, when cut and polished, has been sold for the Ruby. The most richly-tinted specimens are found in Bohemia, and a pale variety occurs amongst the granite in Malabar.

Spongiform Quartz.—To this variety the Germans have given the name of Schwimmstein, from its property of swimming or rather floating upon the water, by reason of its spongy cellular structure. It is sufficiently hard to scratch glass, and is remarkable for its extreme lightness. It contains a small proportion of Carbonate of lime. At St. Ouen, near Paris, it occurs in beds of Flint; also in Cornwall.

Flexible Quartz is of a granular structure, and occurs in thin layers near St. Gothard, and in Brazil. A reddish variety is also found near Whitby, in Yorkshire, which is very flexible. Its flexibility is supposed to be owing to the particles of Mica which traverse it.

Quartz also occurs *radicated, stalactitic, and arenaceous*. In this latter form it is so familiar to all lovers of the seaside, as to need no description. The phrase "numerous as the sands of the sea-shore" is venerable for its antiquity, and is well calculated to lead the mind from the consideration of earthly things to those of a higher nature. But apart from this, who can hear the 'sea-shore' mentioned, without a thousand pleasing remembrances crowding upon his mind?—Again in fancy we are children, plying our little wooden spades as in days gone by,—rearing immense structures of sand,—transporting, by dint of great exertion, the largest blocks of chalk that we can carry from the foot of the cliff, and cleverly imbedding these in the walls of our fortress, thinking that we have succeeded in erecting a monument that shall withstand the strength of the waves' and still be visible on the morrow. Alas, the child is no more exempt from disappointment than the man; and on the morrow, when, in straw hat and belted pinafore, we visit the scene of yesterday's heroic labor, all we behold is a boulder or two of chalk in very different positions from those in which we left them. At a more advanced age, too, the delights afforded by a week's sojourn on the sea-coast increase rather than diminish. The merry yachting parties,—the morning bath,—the early rambles in search of shells and fossils and sea-weeds, or chasing the crabs as they slide along the sands; all these pursuits though apparently trivial in themselves, are of no small amount of gratification.

But the grand source of delight of the sea-side is beautifully described by Mallet:—

With wonder mark the moving wilderness of waves,
From pole to pole through boundless space diffused,
Magnificently dreadful where, at large,
Leviathan, with each inferior name
Of sea-born kinds, ten thousand thousand tribes,
Finds endless range for pasture and for sport.

"Adoring own
The Hand Almighty, who its channelled bed
Immeasurable sank, and poured abroad,
Fenced with eternal mounds, the fluid sphere;
With every wind to wait large commerce on;
Join pole to pole, consociate severed worlds,
And link in bonds of intercourse and love
Earth's universal family."

Whilst these scenes, so productive of reflection to all are particularly so to those who have devoted their time and thoughts to the study of animated nature, the mineralogist finds abundance of material for his cogitations and attention. Oxygen and hydrogen, the elements of which water is composed, are present in a vast number of mineral substances, and water is often an essential constituent of mineral. The long range of precipitous chalk cliffs on the coast, again, present a very familiar, though very perfect illustration of Car-

bonate of lime; and, imbedded therein, are found brilliant groupings of another very common substance viz. Iron pyrites.

But the great objects of interest to the mineralogist presented on the sea-shore, are, the flint, which runs into layers between the chalk, and is also composed principally of Silica, and the sands on which he takes his morning glance at the newspaper. These two substances form the great proportion of all our manufactured glass; and with a short extracted notice of the manufacture of this highly beautifully and important article, we conclude our observations on the varieties of Quartz.

For the manufacture of glass two materials are absolutely necessary: these are, a siliceous earth and an alkali; Silica alone being infusible, but, mixed with an alkali, readily running into glass on the application of heat. This discovery was, according to Pliny, accidentally made. He relates that glass was first made of sand, found in the River Belus, Galilee, and that the discovery originated in the following manner. A merchant-ship, laden with nitre, being driven upon the coast, the crew went ashore for provisions, and, dressing their victuals upon the shore, made use of some pieces of alkali to support their kettles. By this means of a vitrification of the sand beneath the fire was produced, which afforded a hint for the manufacture. (Ree's Cyclopaedia.)

Common black flint makes very fine and clear glass. This is first heated, and the plunge into cold water; the heat whitens it, and the water causes it to split in every direction, and facilitates the grinding of it: but the cost of preparing this prevents its being commonly used. Sand is, therefore, almost the only substance now used in the British manufacture of glass. The fine white sand is the best for the purpose of making clear glass, and our glasshouses derive the principal supplies of this quality from Lynn in Norfolk, from Maidstone, and from the Isle of Wight. For green glass, the coarser sand from Woolwich is used.

The alkali, necessary to vitrify the siliceous matter, is derived from the ashes of many kinds of plants, amongst which are the hramble, the fern, beanstalks, and many others: for though alkaline substances occur in a mineral state, they are not sufficiently abundant in England to be rendered available for this purpose.

Other ingredients, such as Oxide of Lead and of Manganese, are occasionally introduced, for the purpose of freeing the glass from impurity of color, and to render it more easily wrought.

The first operation is termed *fritting*: that is, the materials are subjected to gradual heat, the effects of which are to expel all moisture from the ingredients, and to cause a partial union between them. This partially vitrified matter is then thrown with iron shovels through a side opening into the furnace, the fire having been already raised to its greatest intensity. When the glass pots in the furnace are filled, the side opening is closed up with wet clay, excepting a small opening for watching the progress of the work. To this fierce heat the glass is subjected until, it become perfectly refined, which usually occupies about forty-eight hours. It is then allowed gradually to cool, and becomes in a fit state for working.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard, work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 222 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. On the chemistry and geology; 4th. Improved system of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work. (Morning Call.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work is "The Miner's Companion and Guide, and treatise of California Mines exclusively." It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale. (See News.)

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press" for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its utility and worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidity. We earnestly commend it to those who are practically interested in bringing to light from Mother Earth's hidden treasures. (Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths. fine.....3cts per oz
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register as most congruous with the physical aspects of the material but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP, First street, between Mission and Howard, San Francisco, California.—By recent additions to our extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanscom's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Our Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent, and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour or arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartlett Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the enter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of enter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- 12d. We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munia & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

F. L. A. POCHE, President.

m28

J. H. APPEGATE, Secretary.

A Beautiful Extract.

The following paragraph, from the May number of the Wisconsin Farmer, was written by Prof. J. W. Hoyt. It contains both poetry and sublime truth. The article from which it was taken is upon "The Plant—Sources and nature of its Food."

"To the majority of men, we are satisfied that the soil is nothing but dirt; but to the chemist who knows its origin, its history its nature and its capabilities, it is a wonderful mixture of those beautiful elements which, in their ever varying forms, become the ambient air, the liquid ocean, the precious opal, the amethyst, the jasper, and the still more precious diamond: or the delicate blue-bell and the violet, the amaranth, the lily and the rose, the spire of blue grass and the cedar of Lebanon; or again, the ruby lip, the palpitating heart, and yet more wonderful brain! These are the jewels of which the soil is composed, and out of which the husbandman so unheedingly strives to force the food his hunger craves. Henceforth as he turns the furrow of his field, let the sleep of his thought be broken by the reflection: This earth, thus stirred by my plowshare, is doubtless composed in part, of the ashes, of ancestral heroes, whose deeds are the history of the past, and whose mortal remains are the plastic material out of which we are building the bodies of the men of to-day."

Sales of Mining Stocks.

In Mining Stocks there is positively nothing doing at the present time. We have not heard of a single sale of Washoe stock for two weeks past, or more.

Small quantities of Esmeralda ground are occasionally offered, but few buyers found unless at prices ruinously low, hence very little ground changes hands. In mining stocks of all sorts, extremes have finally met. Henceforth we may look for better appreciation and a consequent rise of the present known to be rich lodes along the whole Eastern Slope from Washoe to the Colorado.

Quite a slaughtering of hogs has been going on in this vicinity for the past week. We hear of the following lots having been killed, and add the packers' estimate of the amount of pork and lard;

Owners	Hogs, No.	Lard, lbs.	Pork & Bacon lbs.
Matthews,	400	12000	80,000
Nichols,	100	3000	20,000
Baker & Keeney,	300	9000	60,000
Ouderkirk	110	3300	22,000
Marlow	50	1500	10,000
Stout	50	1500	10,000
Work	10	300	2,400
Total,	1020	30,600	204,400

—Visalia Delta.

MINERS in the vicinity of Klamath Lake are reported by Indians to have found "heaps" of gold.

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH,
GOVERNMENT HOUSE,
SAN FRANCISCO.

N. B.—R.W. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will hereafter transact all business pertaining to patents for us, a patent office in Washington city. For instructions and the new law regulating patents, we refer the inventor to the above.

Miners, Inventors, Agriculturalists, Capitalist and Mechanics, will find it to their advantage to subscribe for the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers! This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

UNION IRON WORKS (ESTABLISHED IN 1841)

N. E. Cor. First and Mission streets, San Francisco.

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the twelve years, during which time new and extensive Buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS, MACHINERY AND CASTINGS,

Of every description; on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Powers, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work, Steamboat Repairing and Blacksmithing, etc. STEAM ENGINES BUILT AND REPAIRED.

Besides the extensive assortment of Machinery Patterns, attention is called to the new and beautiful designs for Building Castings, Iron Fronts, Columns for Stores, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, Etc.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & G. M. WOODWARD'S PATENT.—This Pump is used for supplying Steam Boilers, Mills and Public Buildings, with water. In case of Fire it is arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the Discharge Outlet. It is suitable both for Maritime and Mining purposes, being used on nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED.

PETER DONAHUE, Proprietor

OILS AND LAMPS BY LATE ARRIVALS.

STANFORD BROTHERS HAVE RECEIVED

A GREAT VARIETY OF COAL OIL LAMPS of every style of BURNING known to the trade.

BRACKET LAMPS and SIDE LAMPS with the largest burners in use. PARLOR and STAND LAMPS—An endless variety of Patterns. CHAMBER LAMPS and HANDLE LAMPS—Very cheap; may be carried about.

CHANDLERS AND LANTERNS. CAMPHENE LAMPS OF ALL KINDS. COAL OIL and CAMPHENE WICKS. CHIMNEYS, SHADES, GLOBES—Of every size, style and finish.

200 BARRELS Sperm Oil—At a lower price than ever before sold in this city.

100 BARRELS Lard Oil—Of our own importation.

600 TUBS RAPE SEED OIL—In original packages.

100 BARRELS BOILED LINSEED OIL—guaranteed pure and free from fish oil.

400 CASES DOWNER'S KEROSENE.

800 CASES COAL OIL—At the very lowest market prices.

1,000 CASES CHINA OIL—In 2½ gal. tins.

We feel confident in assuring our CUSTOMERS and the TRADE generally that they will find our assortment of LAMPS and LAMP STOCK, as well as OILS and all kinds of BURNING MATERIALS, the most complete that has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms; and we are determined to fix our prices at a standard so low that dealers in a line of goods can lay in their Winter Stocks, and have a wider margin of profit than they have ever had before.

STANFORD BROTHERS,

121, 123 and 125 California street,—Near Front.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, JANUARY 4, 1862.

NO 16.

A. J. KIRKHAM'S PATENT AMALGAMATOR.

Opal.

Mr. K. describes the machine represented by the engravings thus: *A* (fig. 1) is a cast-iron pan, four feet in diameter, five inches deep, having a chamber or recess *B* in the centre of the bottom, fourteen inches in diameter by six and a half inches in depth. This outer pan stands on three cast-iron legs or pillars; height from the ground about twenty inches. *C* is a cylinder, twelve inches diameter (see fig. 2), fixed by four bolts to the bottom of the chamber *B*, which is fourteen inches in diameter, leaving a space between *B* and *C* of one inch all round: the bottom being notched out at intervals *b b* (fig. 2) to allow the quartz tailings as they pass from the pump *E* (fig. 2) through the triturators, and perforated holes, in cylinder *C*, up the space marked by arrows, into the bottom of the pan *A*, which, with the cylinder *C*, is filled up with quicksilver, covering the bottom of the pan *A* about half an inch. Inside of the cylinder *C* are three closely-perforated plates with conical holes, the small part upwards, which plates are fixed by four small set screws from the outside of cylinder *C*; these plates, *s s*, being $1\frac{1}{4}$ inches apart, to allow two triturators *D* to revolve within an eighth of an inch of the fixed plates *s s*. These triturators are fixed on a spindle *H*, working through a stuffing box *I*, and are driven by a belt from the upright shaft *K*. *L* is a set screw-bolt, fastening, padlocked and only may be removed when cleaning out the amalgam, which may be done once a week, or when required.

On the top of the cylinder *C*, is fixed the pump *E*, the top of which is seven inches diameter with a six inch plunger, a space being left around the plunger of half an inch on each side: the top is an ordinary stuffing box; at the bottom of this stuffing box there is an inverted leather cap fitting the plunger, which cleans it on the up-stroke, and protects the stuffing box from the grit, &c.—the stroke of the plunger is nine inches. There is only one valve to this pump, and this is at the top, as shown at *F* (fig. 2). This valve is self-acting, being a flap-valve, with a triangle edge on the outside, closing on a piece of India-rubber, which is let in the face of the casting, *G*. There is no friction, and little or no surface for any of the crushed quartz to lodge to prevent efficiency in working. *M* is a shoot from the batteries; *N* is a light casting, three feet eight inches diameter, ten inches deep; across the bottom are twenty arms, (see fig. III), extending to the circumference—this moves round the outside of the pump *E*, worked by a pinion on the upright shaft *K*, the pinion working in the cogs fixed on the outer rim of the cylinder *N*, and can be regulated to clear the bottom of the pan *A*, containing the mercury, within an eighth of an inch. There is a sheet-iron cover *O* (fig. 2), secured by a screw bolt and padlock, which prevents any interference with the working, and only to be removed if necessary when cleaning up. There is also a pipe coming from the bottom of the cylinder *B*, with a glass tube to show the height of mercury at starting to work, and to indicate the quantity of amalgam taken up daily. Thus the manager can know what is doing in the amalgamator.—*Colonial Mining Journal*.

Removal.

The Office of this Journal will remove to Merchant, between Sansome and Montgomery streets, up stairs.

THE OFFICE of the PACIFIC PATENT AGENCY will hereafter be found in the building formerly occupied by the U. S. District Court, on Battery, cor. Washington sts., up stairs.

Opal, like Quartz, consists chiefly of Silica and water, but generally contains more of the latter than is found in Quartz. Of this mineral there are several distinct varieties, none of which are sufficiently hard to give sparks with steel, like most of the varieties of Quartz.

Precious Opal, or *Noble Opal*, is one of the most beautiful of gems, and in its polished state is so highly valued, that fine stones have frequently been sold at the same price as diamonds of equal size. The cause of the splendid flashes of red, blue, green, and yellow, which this mineral exhibits, is not fully understood, but they are said to be owing to the refraction of light in fissures dispersed throughout the mass. Whatever the cause however, the effect is exceedingly charming, and may well account for its great value. It is translucent, its fracture is conchoidal, and its lustre vitreous. The most capital specimens in the matrix are brought from Czerwenitz in Hungary; it also occurs in the Faroe Islands and in Saxony. A variety of milk-white color, with a faint shade of blue, has been obtained in specimens of considerable splendor from Honduras, in America.

Hydrophane, which is usually opaque, possesses the remarkable property of becoming both transparent and iridescent when immersed in water. It adheres to the tongue, and is softer than Precious Opal, with which it occurs in the same locality and matrix: we consider it to be this latter substance in a state of partial decomposition. Hydrophane has been used as a gem. It contains some Alumina.

Common Opal occurs of various colors, but is usually more or less opaque. One variety is termed Ferruginous Opal, from its containing a little Iron. Common Opal is abundant in Hungary, and is also found in Ireland and in Cornwall.

The above illustration is an excellent picture of the beautiful funeral car and catafalque, expressly gotten up and devoted to the funeral obsequies of the late and lamented Col. E. D. Baker. The car and catafalque presented a truly imposing appearance: the latter was designed by Mr. William Turkington, foreman in the establishment of Mr. Nathaniel Gray, on Sacramento street: was finished off and decorated in an artistic style, and reflects much credit upon the executor. It was indeed a fitting couch for the remains of the lamented dead, while being conveyed to their last resting place. Col. Baker's eloquence, manly bearing, and final sacrifice on the altar of his country, had indeed won the hearts of thousands upon thousands of our people, which was plainly made manifest on the day of his funeral, the 11th day of Dec. last.

"Ah, never shall the land forget
How gushed the life-blood of the brave,
Gush'd warm with hope and courage yet,
Upon the soil he fought to save."

The Gold of Nova Scotia.

The following excellent synopsis on the gold of Nova Scotia by Prof. O. C. Marsh, Yale College, will be found highly interesting and is taken from the American Journal of Science and Art.

On the Atlantic coast of Nova Scotia is a belt of metamorphic rocks extending the whole length of the Province and varying in width from ten to fifty miles. It is mainly composed of clay slate and quartzite, but in some parts of the district these are replaced by mica slate, gneiss and granite. These strata have a general N. E. and S. W. course and are highly inclined. They have received but little attention from geologists and as no fossils have yet been found in them their exact age has been a matter of considerable uncertainty. Prof. J. W. Dawson, who from his study of this region is best qualified to express an opinion on this point, states that they are probably Lower Silurian, and possibly of the same age as the Potsdam sandstone.

The general resemblance of these strata to the gold-bearing rocks in other parts of the world had occasionally been noticed, and various explorations for the precious metals had from time to time been made in their vicinity, but I cannot ascertain that gold was actually discovered in this Province earlier than March, 1860, although reports to that effect have been circulated. It was then accidentally found in Halifax county, about fifteen miles from the coast, in the bed of a small stream which empties into the Tangier river. Gold was soon after observed in the adjacent quartz veins also, and in a short time several hundred persons were attracted thither by the reports of the discovery and commenced explorations. The quantity of the gold obtained, however, was so small, that the excitement soon diminished, and but one company continued work for any length of time. In May of that year, the Provincial Secretary, Hon. Joseph Howe, accompanied by Prof. How of King's College, made an official visit to the locality, and on his return published a report which was very unfavorable to future explorations.

The discovery of gold in the Province, although in small quantity, naturally encouraged a further search, and in March of the present year it was again found, on the coast near Tangier harbor, in sufficient abundance to promise profitable employment for a great number of persons, and since that time a large amount has been obtained from that locality. Within the next three months gold was discovered in the same strata at various other places, the most important of which are Rawdon and Douglass, in Hants county; Gold river, near Chester; and Lawrencetown, a few miles east of Halifax. At the latter place there are indications of an extensive deposit of gold, and an association, organized in London, under the name of the "Nova Scotia Gold Mining Company," has recently purchased a tract of land there, and obtained permission from the government to work it for a term of years. In June last, gold was discovered in a bluff on the coast near Lunenburg, and shortly after the sands on the beach below were found to be unusually rich in this metal. It has also been found quite recently at Lake Thomas, about fifteen miles north of Halifax, and some valuable specimens obtained.

While in Nova Scotia a few weeks since I visited Tangier and Lunenburg, the most important of the above localities, and through the kindness of Mr. S. P. Fairbanks, the Provincial Inspector of Mines, I had an opportunity of examining the gold-bearing strata at these places and in their vicinity. I am also indebted to this gentleman for many interesting facts in regard to the discovery of the gold.

The Tangier mines are situated sixty-seven miles east of Halifax and about half a mile from the coast. Here the outcropping rocks form a series of low hills, which are covered with a thick growth of spruce and hemlock. The strata which contain the gold consist of clay slate, traversed in various directions by veins of quartz, which is generally very compact. The cellular variety, discolored by oxyd of iron, so commonly found with the gold in California and Australia, appeared to be wanting at this locality. The strata, which are here very much disturbed, had been well exposed in many places by the recent explorations, but the nature of the surrounding country prevented any extensive examination of them. At one point they had a strike of S. 84° E. and a dip of 67° S.

The excavations at Tangier were carefully examined for fossils but without success, as the igneous action to which these rocks have been subjected has probably obliterated all traces of those they once contained. The recent discovery, however, of very perfect fossils, of many new species, near Saint John, New Brunswick, in clay slate which closely resembles this in structure, would seem to indicate that some organic remains may have been preserved in this formation.

The gold at Tangier occurs mainly in the quartz veins, which are in most cases less than a foot in width, but in one instance I noticed it in the argillite near its junction with the quartz. It is disseminated through the matrix in the usual manner,—frequently in isolated particles and masses, and where the quartz is white furnishes specimens of great beauty. One of the largest obtained was prized at three hundred dollars, which was but little above its intrinsic value. Gold has also been found in the soil, and in the bed of a small stream near the mines; but not in sufficient quantity to attract much attention.

The minerals noticed in association with the gold at this locality were mostly iron pyrites and mispickel. The former appeared to be quite abundant, and, suspecting it to be auriferous, I have examined a specimen and find it contains a considerable quantity of gold. The exact amount was not estimated, but it is sufficient to make its separation profitable if conducted with skill and economy. The mispickel at Tangier is frequently found underlying the gold in the quartz veins, and in some cases enclosing it. Chalcopyrite, magnetite, hematite, and galeua, also occur in small quantities.

Among the specimens of gold obtained at Tangier I noticed three isolated crystals, which resembled in general appearance those brought from California. The largest of these was about one third of an inch in diameter. It was a rhombic dodecahedron with its edges slightly beveled, and although its faces were marked with delicate striae several of them were unusually brilliant. The other two crystals were octahedrons, with dull and somewhat rounded faces. One of these was flattened and also much elongated. The smallest crystal was about two lines in length and quite perfect.

The mines at this locality are on the Government lands, and a 'claim,' thirty by thirty-three feet, is rented at twenty dollars per annum. At the time of my visit in August, about seven hundred men were working 'claims,' and a large amount of gold had been taken from the quartz veins, although in many cases at least one third of what they contained was lost by the rude and unsatisfactory methods employed in its extraction. Two crushing mills, however, were then nearly completed, which, although very unlike, were apparently well adapted to the end in view. One of them was very similar to the *arrastre*, a rude instrument used extensively in the silver mines of Mexico, and found to be very effective. It consisted, essentially, of two large granite boulders, attached by short ropes to a horizontal

beam, on either side of an upright shaft, around which they were drawn by a pair of horses. The quartz was put on a paved floor and kept wet, and was crushed by the boulders as they were dragged over it. The other mill was a small sized quartz-crusher of recent invention.

At Lunenburg, which is about seventy miles west of Halifax and one hundred and thirty from Tangier, the gold also occurs in quartz veins traversing the clay slate, which here forms a high bluff, but it is most abundant in the sands of the adjacent beach. Those who first commenced explorations at this place obtained large quantities of gold with very little labor, and their success soon attracted others from all parts of the Province. This locality is known in the neighborhood as "The Ovens," from some deep caverns which have been worn in the bluff by the action of the sea. It is this denuding power which has torn the gold from its bed and collected it on the beach. There is some reason to believe that a large amount of gold derived from the same source exists in the bottom of the harbor, as the sea-weed which is washed on shore has occasionally small particles of the precious metal attached to it. This point will probably soon be decided; as a "Dredging Company" has been formed, and in a short time will commence operations.

The strata at this place are similar in appearance and structure to those at Tangier, and seem to have been equally disturbed. At one point near the shore where they were well exposed the strike was S. 80° W., and the dip about 75° N. Quartz veins pass through the slate in many directions, and are generally found to contain gold, especially those running north and south. Several dikes of basaltic trap were also observed, one of which was seven feet in width and appeared to be conformable to the strata. The auriferous sand on the shore rests on the edges of the upturned slate, which has here been worn out into 'pockets' of various sizes, well adapted to retain the gold as it is washed over them. After these cavities have been apparently exhausted, a large amount of fine gold can be obtained, for several feet beneath them, between the thin laminae of the slate.

Nearly the same minerals which were noticed at Tangier also occur with the gold at this locality. The mispickel is more abundant, and is usually in very perfect octahedral crystals, some of which are twins and highly modified. The large amount of this substance in the sand on the beach, makes the gold washing somewhat difficult, and with the rude apparatus employed much of the fine dust is lost. Mercury has not yet been used in separating the gold either here or at the other localities.*

It is impossible to form any reliable estimate of the amount of gold obtained in Nova Scotia since its discovery there in March last, as in almost every instance the 'claims' have been worked by private individuals who were generally disinclined to give information in regard to their own success. Nor would the amount alone, if ascertained, be a fair criterion by which to judge the value of the gold fields, since they have in most cases been explored by those who have had no previous experience in searching for gold, and only the rudest methods have been employed in obtaining it. I was informed that gold to the value of \$2400 had been taken from one 'claim' at Tangier, \$1300 from another, and \$480 from a third, although many other 'claims' had yielded little or nothing. I saw in Halifax ingots and specimens of Tangier gold which were valued at about \$2000, and at Lunenburg at least \$250 worth of fine dust which it was said had been washed from a single 'pocket' on the beach.

I have recently analyzed some specimens of gold which I obtained at Tangier and Lunenburg, and the results are given below. The Tangier specimen was taken from a quartz

* While at Lunenburg I was informed of a circumstance connected with the discovery of the gold which illustrates the utility of even a little scientific knowledge, and the need of its more general diffusion. Some years since a farmer, living in the neighboring town of Chester, thought he had discovered a valuable copper mine on his land, and at a great expense sunk a shaft about eighty feet in depth. Finding little copper to repay his labor, and having exhausted all his means, the work was finally abandoned. In his excavations he had cut through a large quartz vein richly stored with gold, which he had noticed, but supposed to be merely copper pyrites. The present owner works this copper mine for gold.

vein, and is very remarkable for its purity. I find it is surpassed in this respect by the gold from only one other locality, viz. Schabrowski, near Katharinenburg, in Siberia. The Lunenburg gold was in small particles, washed from the sand on the shore. In preparing for the analyses the gold was hoiled in chlorhydric acid, fused twice with borax and hammered, and its specific gravity taken. The quantity employed in each case was between one and two grammes, and the analyses were made according to the method used by Rose in his investigations on the gold of the Ural mountains.

An analysis of the Tangier gold, specific gravity 18.95, gave,

Gold, - - - - -	98.13
Silver, - - - - -	1.76
Copper, - - - - -	.05
Iron, - - - - -	trace.

An analysis of Lunenburg gold, specific gravity 18.37, gave,

Gold, - - - - -	92.04
Silver, - - - - -	7.76
Copper, - - - - -	.11
Iron, - - - - -	trace.

In some specimens of auriferous quartz from Lawrence-town, obtained of Mr. R. G. Fraser of Halifax, I found mispickel, iron pyrites, galena, and magnetite, associated with the gold in the same manner as at the other localities. In one instance a crystal of mispickel had a small particle of gold passing directly through its center. The specific gravity of the gold from this place was 18.60, which would indicate a degree of purity between that of the Tangier and Lunenburg specimens. The quantity obtained was not sufficient for satisfactory analyses.

Mr. Fraser informed me that some time since, in company with several others, he made explorations for gold on Sable Island, and found a small quantity in the sand of which it is composed. As this island is more than one hundred miles from the coast, this discovery would appear to indicate that the gold-bearing strata of Nova Scotia extend for a considerable distance beneath the Atlantic ocean.

There is another belt of metamorphic rocks in the northern part of this Province which resembles in many respects that on the Atlantic coast, although it probably belongs to a more recent formation. The Cobequid mountains are in this district, and are mainly composed of talcose and chloritic slates, penetrated by dikes of green-stone, sienite and granite. While passing this range in August last, in company with Mr. W. P. Ketcham of New York, I noticed a close resemblance between these rocks and the auriferous strata which I had just examined at Tangier and Lunenburg. The quartz veins were of similar size and appearance, and contained some of the same minerals which are there associated with the gold. I think it probable that these strata also will be found to contain this metal, although the hasty and imperfect examination, which we then were enabled to make, was not rewarded by its discovery.

A public geological survey of Nova Scotia is much needed, and a considerable part of it could be made with comparatively little labor; as in some parts of the Province the formations are so interesting that they early attracted the attention of scientific men, and have been very carefully studied. The districts, however, in which gold has been discovered, and in which it is likely to be found, have been only casually examined, and a systematic survey would make known their real value and prevent the recent discoveries from proving a misfortune, by impairing more important branches of industry. Now that the monopoly of the "General Mining Association," which has so long obstructed the development of the rich mineral resources of the Province, has been removed, it seems especially desirable that this survey should no longer be delayed. The revenue derived from the rent of 'claims' in the gold fields would probably be more than sufficient to carry on the work and could not well be devoted to a better purpose.

The great extent of metamorphic strata in Nova Scotia, so similar to the gold-bearing rocks in other countries, and the fact that gold has now been found at many widely separated points, would seem to indicate that a new and important source of mineral wealth will soon be added to this already favored Province.

Mining Companies and Associations.

Office Dios Padre Gold and Silver Mining Company, 215 Front street, San Francisco, September 26, 1861.—Notice is hereby given that an assessment of one dollar per share on the capital stock of this company, was levied this day to be paid in installments at the office of the company as follows: Twenty-five cents per share, on or before the 29th inst.; twenty-five cents per share on or before the 25th of October proximo, and fifty cents per share, on or before the 28th of Nov., 1861.

Shareholders will take notice that delinquent stock will be proceeded against in strict conformity to law.

By order of the Board of Trustees,

JOS. P. NOURSE, Sec'y.

Office Chollar Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the Stockholders of this Company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

W. E. DEAN,

Sec'y Chollar S. M. Co.

A Meeting of the shareholders of the Summit company will be held at the Gold Hill Bakery, in Gold Hill, on Friday, Nov. 16th, at 7 o'clock P. M. Punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.

JOHN DOHLE.

Office Bolthouse Gold and Silver Mining Company, Van Horn District, 305 Montgomery street, San Francisco. Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock P. M. T. L. HERBINS, Sec'y.

Savage Gold and Silver Mining Company. A meeting of the stockholders in the above company will be held at 10 o'clock, A. M., the 17th day of December 1861, at the office of Leal, Sherwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Norcross at Virginia City, to A. K. Head Nevada; or the undersigned before the 14th day of December next.

WM. M. LENT, President.

San Francisco, November 27, 1861.

Notice.—There will be a meeting of the Silver Gold and Silver Mining Company, on Sunday, November 17th, 1861, at 11 o'clock A. M., at the house of M. H. Bryan, Virginia City.

A punctual attendance is requested, as business of importance will come before the meeting.

no29

M. H. BRYAN, Sec'y.

Shareholders of the Osceola Gold and Silver Mining Company are hereby notified that the meeting of the Trustees of said company in Virginia City, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to H. H. Russell, Virginia City.

Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Ladington & Russell, in Virginia City, on Saturday, the 10th day of December next, between the hours of twelve and three P. M.

J. S. WATKINS, Treasurer, Osceola G. & S. M. Co.

Virginia City, Nov. 2, 1861.

Office Alpha Silver Mining Company, San Francisco, Nov. 26th, 1861.—The Annual meeting of the Stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 11 o'clock A. M., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

JAS. W. WHITE, Sec'y

Notice is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia City, N. T., on Saturday the 23d inst., for the purpose of organizing said company. All delinquencies are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

R. T. SMITH,

President Arizona Company.

Office.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mina Rica," "Guasaba," "Fortune," "Santa Cruz," and "Sacramento," situated near San Antonio, Lower California, Mexico.

CHAS. J. DUPRAT,

EM. LEYA,

DUPRAT, SCHMITZ & CO.,

CHAS. KRAFT & CO.,

La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California.

For further particulars respecting the above named mines, inquire of

JOS. J. DUPRAT,

423 Washington street.

GOLD HILL TEXAS CO.—The meeting called for Saturday, November 9th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the saloon of Webb & Cappers, Gold Hill.

A punctual attendance is requested, as business of importance will come before the meeting.

ROBERT APPLE, Sec'y.

Shareholders of the California Gold and Silver Mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 20th inst., to the Superintendent, at his office in Gold Hill, or to W. B. Aikard, San Francisco.

Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 9th day of December next.

By order of the Board of Trustees,

Gold Hill, Nov. 4th, 1861.

POSTPONEMENT OF SALE.—The sale of mining ground, at Silver City, by the Kansas Mining Company, is postponed until four o'clock, P. M., Tuesday, Nov. 10th, 1861. Sale to take place on the grounds of the company. Delinquents will please take notice and "come to time."

By order of the Board of Trustees,

R. C. CHAPPELL, Sec'y

Virginia City, Nov. 9th, 1861.

TORRES SANTOS COMPANY.—The members of the Torres Santos Company are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary on demand. Also that the several interests of the members, who fail to pay their said assessments, on or before the 10th day of November, instant, or so much thereof as may be necessary to pay said assessments, together with cost of advertising and sale, will be sold at Public auction to the highest bidder, on Wednesday, Nov. 20th, 1861, in front of the office of John Kelly, on B street, in Virginia.

By order of the Board of Directors.

L. W. FERRIS, Sec'y

GOLDEN GATE COMPANY, GOLD HILL DISTRICT.—A meeting of the shareholders in the above named company will be held at the office of H. O. Gaylord, in Virginia on Saturday, Nov. 16th, at 7 P. M.

T. A. MONKHOUSE, Sec'y.

Members of the Senator company, Congress League, Devil's Gate District, are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

L. W. FERRIS, Sec'y.

Office of the Desert Mining company, 309 Montgomery street, San Francisco, Nov. 23d, 1861.—The stockholders are hereby notified that an assessment of one dollar per share on the capital stock of the Desert Mining company, has this day been levied, payable on or before the 25th day of Dec. next, at the office as above.

By order of the Board of Trustees,

J. H. LYON, Sec'y.

Notice.—The regular annual meeting of the stockholders of the Cedar Hill Tunnel and Mining Company will be held at the office of the Secretary, on Thursday, January 2d, 1862, at 7 o'clock, P. M., for the election of officers for the ensuing year, and such other business as may come before the meeting. San Francisco, December 2d, 1861.

C. L. FARRINGTON, Sec'y.

Office St. Louis Gold and Silver Mining Company.—Notice is hereby given that the Board of Trustees of the St. Louis Gold and Silver Mining Company have, this 15th day of October, 1861, levied an assessment (for completing their mill) of two dollars upon each share of the capital stock of said company, payable to the Secretary, at No. 40, Montgomery Block, San Francisco. By order of the Board of Trustees.

J. H. BREWER, Secretary.

Office of the Cole Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cole Silver Mining Company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees,

J. B. COFFIN, Sec'y.

Office Dios Padre Gold and Silver Mining Company, 215 Front street, San Francisco, October 20th, 1861.—A meeting of the stockholders of the Dios Padre Gold and Silver Mining Company, held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees,

JOEL F. LIGHTNER, Secretary.

Office Gould & Curry Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which was made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HINGEN, Secretary.

Office Crown Point Gold and Silver Mining Company, 321 Front st., San Francisco, Oct. 28th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

Office Crown Point Gold and Silver Mining Company, 321 Front street, San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining Company has this day been levied, payable on or before the 10th of December next, at the office, as above.

J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining Company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 28th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City; or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given that all stocks of this company have this day, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company. All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOS. S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty-sixty or ninety days from date, to the Treasurer of the company.

By order of the Board of Trustees,

JOS. S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees,

HENRY S. HUDSON, Sec'y.

San Francisco, Nov. 8, 1861.

Office Sierra Silver Mining Company.—At the Annual Meeting of the Stockholders, held Monday evening, December 9th, 1861, the following gentlemen were elected Trustees to serve for the ensuing year: H. Collier, Daniel Norcross, F. D. Connor, James Chapp, Calvin Taylor, R. R. Noblett, T. J. Furber, Isaac Tubar, E. Baker, Henry Talbot.

DANIEL NORCROSS, Sec'y. S. S. M. Co.

At a meeting of the Board of Trustees, held Thursday evening, Dec. 12, 1861, the following officers were elected to serve for the ensuing year.

F. D. CONNOR, President.

W. H. CULVER, Treasurer.

DANIEL NORCROSS, Secretary.

D. NORCROSS, Sec'y.

At a meeting of the Board of Trustees, held Thursday evening, Dec. 12, 1861, an assessment of \$1 per share was levied, payable at the office of the Secretary.

D. NORCROSS, Sec'y.

144 Sacramento street.

Notice.—The annual meeting of the Charles Cuy mining company, will be held at the office of the company (D. Davidson's room, northeast corner of California and Montgomery streets, San Francisco) on Friday Dec. 27th, A. D. 1861, at 3 o'clock, P. M. of that day, for the election of officers for the ensuing year, and transaction of such other business as may be presented. A punctual attendance of all stockholders is requested.

By order of the Board.

ALEX. FLY, President.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....JAN. 4, 1862.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansone sts., by

J. SILVERSMITH, Editor and Proprietor.

At Fifty Cents per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEROTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

New Inventions.

That the people of California are prospering is daily proved, to our mind, by the ingenuity exhibited in the completion of new inventions, many of them of great merit. In earlier days our people had not time to spend a year or two in the development of what at first may truly be called a fancy of the brain. Things have changed, however, for it soon became apparent that California offered a new and very extensive field for industry of this kind. New appliances must be produced or perfected to apply to this new field, until now the completion of a new invention is almost an every day occurrence. We are called on oftentimes, during every day in the week, for advice or aid in securing patents. And in our opinion an increase may be looked for continually.

Up to the present time most of the new inventions are applicable to quartz mining or agricultural pursuits, and although neither of these fields are exhausted, yet there are many others which inventors should not overlook. In placer mining perfection has been arrived at wherever water is plenty, and sufficient fall can be had for working sluices, a bed rock flume and a hydraulic. But for dry diggings (Nevada Perceps for instance) a machine must be invented to supersede the old-fashioned rocker, which neither saves the fine gold or coarse, the latter being oftentimes thrown out of the sieve with the "headings." Then again, on flats, where there is not sufficient fall, although water may be plenty,

some contrivance is necessary to elevate the gravel and the water, perhaps neither, if ingenuity can devise some other and better plan.

Another field we will mention is in our forests, along the coast and elsewhere. We want machinery invented to cut down those giants of trees, found almost everywhere along the Pacific Slope, and after they are down cut them into saw logs.

There are many other fields we might mention but have no space, neither deem it necessary. Ingenious minds will find no lack of employment, and as long as our government gives the protection it now does, and the reward is as sure and certain as it has invariably been heretofore to the inventors of meritorious machinery, we may continually expect new additions to the already large number invented in our State.

Swamp and Overflowed Lands.

The general government soon after the admission of California, in a spirit of benevolence, and wisely, in our estimation, ceded all the overflowed lands within our boundaries, to the State to be sold and used for the encouragement of educational purposes. Many of these lands were afterwards surveyed, brought into market, and disposed of. The benefits derived from this gift have already been large. However, owing to a lack of evidence, as to what really were overflowed lands, no title could vest in the State to thousands of acres which were really believed to be subject to occasional overflows; the late floods will allow of no more doubts. The State authorities can now go forward and perfect the State's title to several hundred thousand acres, which would have been lost had it not been for the present overflow—so the truth of the saying, "that there is never a great loss without some gain," has again been verified.

We trust the proper authorities will not delay in this matter but at once take the proper steps to secure the magnificent benefits which will now surely and speedily accrue to the State from this source.

Are the Beds of California Rivers Filling Up?

The great overflow of the Sacramento and San Joaquin rivers the present winter, has confirmed many in the belief that the cause is attributable to the accumulation of mud and sediment occasioned by mining in the mountains; from this belief we dissent, for we are certain the cause is found elsewhere, yet unwillingly have to acknowledge the fact that our river beds are constantly filling up. In corroboration of our belief we offer the following evidence:

Several years ago while engaged in ditching enterprises in the mining regions, we took the trouble of ascertaining the quantity of mud contained in the water running through a certain ditch of ours; by taking samples of the water into proof glasses and allowing it to settle, we invariably found the water to contain at least ten per cent. of mud or sediment, and the sample was no exception either to the waters of most other streams. Again we have seen the beds of streams where water was scarce during summer, raised for miles in length, of from four to ten feet with heavy gravel, washed from the hills, which the ordinary current failed to take along, but which almost invariably was taken away during the winter freshets, and the original bed exposed by spring; it of course does not follow that all this gravel went through to the valleys in one season, but perhaps only shifted lower down. We are certain, however, that much of it went many miles, and in the course of several years must fetch up in the valleys below. Then, again, many logs, trees, brush, etc., are every winter carried down from the mountains, many of which becoming thoroughly soaked with water and covered with sediment, must and do sink, when they arrive at places where the fall is small and the current less strong, and after sinking necessarily aid in stopping more sediment, and finally in raising the beds of the rivers in the valley. These evidences are no imaginations, they are stubborn truths.

Now if there were seasons when these streams had a cessation of this carrying of mud &c., it might be hoped that the current of clear water would again take up these sediments and obstructions and carry them to the ocean, but no cessation occurs, and will not occur until the placer mines in the mountains are entirely exhausted.

We have looked diligently on every side for some agent, cause, or plausible theory to controvert these facts, but have

looked in vain. The laws of gravitation have all to do with the matter, and are fixed laws, and however much we might hope and wish that things were otherwise, the fact is patent to every observer, that the beds of the valley rivers in California are slowly but surely filling up.

But as we said before we do not believe that the present unprecedented overflows owe their origin to this cause, but on the contrary to the early and severe storms, heavy fall of snow, sudden change of temperature, succeeded by heavy rains, and a consequent sudden melting of the snows in the mountains. This is undeniably the true cause. Such combination of circumstances and a similar flood may, however, not again occur in a lifetime. It has not heretofore occurred to the recollection of our oldest white inhabitant.

The losses of property throughout the States of California and Oregon are immense; they may safely be computed at many millions of dollars; the deprivations and sufferings of our people our pen is incapable of portraying; a money estimate will not apply; thousands have lost their all in property, besides perhaps their usual energy and ambition for life. We sincerely trust it may never again fall to our lot to chronicle a similar calamity, and that the floods of the year 1861 were indeed an exception for all time to come.

Patent Applications Issued from this Office.

During the past week we have had the pleasure of perfecting the necessary papers, ready to be sent to Washington, of ten new inventions. Our excellent facilities—being ourselves well versed in relation to Patent Office business, having competent artists in our employ, besides associates at Washington who have been engaged in the business for over fourteen years—enables us to perfect all necessary papers, drawings, &c., and obtain patents in less time and with less expense than any office on this coast, if not indeed in the United States.

Inventors applying at this office can always be furnished with reliable advice as to alleged new inventions, conflicting claims, &c.

We can offer inventors an additional inducement to employ our services, from the fact that we publish a weekly journal of a large circulation, devoted to the mining and scientific interests of the Pacific Coast, through the medium of which we are at all times happy to give their inventions publicity in a manner that will surely ensure greatly to their benefit.

Letters from a distance asking for information on the subject of patents, &c., will at all times be answered promptly with the desired information if in our power to give.

Our Mining Summary.

We humbly beg leave of our kind readers to dispense, necessarily with our usual "quandium" of matter pertaining to our mining interests. Here and there a straggling interior paper contains a two-line item that some out of the way claim made a "clean up." The general import of our "non-indefatigable" mining or mountain cotemporaries harp upon war, holidays, floods, and the like "played out" subjects. Brothers our mines have not been "played out," and we insist that you institute proper inquiry of the results of each week's labor performed by your industrious companies and mining associations. It is of the greatest importance that the credit of our immensely rich mineral field be properly held up before the world.

The rainy seasons of California have heretofore been most prolific in "gold finds," yet we hear nothing from any source. It is true that the floods in various parts of the State have seriously damaged mining claims, but we know of some districts which have not been affected at all. Our correspondents too seem indolent; these complain of bad roads, and the perilous crossings of rivers, etc. Such will serve as a reasonable cause of our failing in presenting our usual "Mining Summary."

Newspaper Envelopes.

Our readers should bear in mind that the Post Office Department has commenced the manufacture and sale of excellent wrappers for newspapers, with stamps thereon that cannot be rubbed off.

They can be had at the San Francisco Post Office in large quantities, at one dollar sixteen cents per hundred, or five for six cents.

Prof. Whitney's Geological Reports.

The time for the assembling of our State Legislature being close at hand, it is a matter of course will soon be gratified with the perusal of the annual scientific report of Prof. Whitney, our State Geologist. There is no interest in the State more closely connected with the general welfare of the whole people of the State, than the development of our mineral resources, therefore anything tending to aid in disseminating reliable and correct information in regard to our immense mineral wealth will at all times be eagerly with interest and pleasure. In our estimation no money ever disbursed from our State treasury was paid for a more worthy object than the salary paid our State Geologist and his assistants, Messrs. Ashburner and Brewer; besides, we deem the State extremely fortunate in procuring the services of so able a servant as we know Prof. Whitney to be. We are content that the report will be highly valuable, as no portion of the State has escaped the attention of the Professor; he has even extended his researches east of the Sierra range, including a portion of Nevada Territory. The latter was a matter of necessity, as it is well known that the Washoe silver mines are situated very near the California boundary, and being more developed than mines farther south, lying within the boundaries of our State, could offer better opportunities for inspecting their peculiarities than the latter would offer. We of course do not anticipate a minute report of all be parts visited, for this would be a matter of impossibility, in fact it will require many years to complete the work just commenced, but we do anticipate statistics invaluable to the practical miner, and which will go far towards confirming the stories of our mineral wealth, which have been so often told by those less competent to judge, and which have as a matter of course been generally received with many grains of allowance.

A Pleasant Beverage.

Our friend, V. Squarza, did us the honor to send us an excellent treat on New Year's Day, in the shape of several bottles of his celebrated Rum punch. We have not tasted a beverage of any kind for a long time as pleasant to the taste as this beverage; besides we know it to be an excellent appetizer, and wholly void of anything tending to leave unpleasant impressions, even after partaking freely thereof, to a charge of which we plead guilty. Mr. Squarza should, and undoubtedly will, soon obtain an extensive sale for this article, and he being the sole manufacturer will, as a necessary consequence, make a fortune therefrom.

Augustin's Method of Extracting Silver with Salt Water.

Modern chemistry has given the metallurgist a third method of treating silver ores and products by what may be entitled "solution and precipitation." It is that which has been pointed out in a former letter as being distinguished by the use of a hot concentrated solution of common salt as a solvent. From this peculiarity and from the name of its inventor, it may be justly called as above.

No metallurgic process springs like Minerva full grown and perfect from the brain of the inventor. Many years of experience, and the labor of many vigorous minds have been necessary to bring some of our simplest processes to the efficient condition in which we find them. The method of Augustin, although it is sometimes considered as having inaugurated a new era in the treatment of silver ores, forms no exception to the general rule. It has a genealogy as long as that of a peer, which if any space permitted it would be interesting to trace back step by step. First to the system of amalgamating the copper matt, a long time in use at Mansfield, with which it has several points of resemblance, then to the European plan of amalgamation in casts, as introduced by Gellert at the Freiberg works in 1790, then back a decennium to the region at Schennitz, where Born amalgamated Hungaria in copper kettles, afterwards—a long step—to the cordilleras of South America where Bartholome de Medinn, in the middle years of the fifteenth century invented the American system of amalgamation as we hear. This extended investigation would, however, be inconsistent with my present object, and hence we will pass at once to a consideration of the method of Augustin, as it is at present in use. The European plan of amalgamation as is well known, consists of three chief processes.

1st. Converting the silver in the ore or product into a chloride, by roasting.

2nd. Decomposing this chloride and dissolving the silver produced in quicksilver.

3d. Evaporating the quicksilver and thus obtaining the silver in an isolated condition.

Augustin retained the chlorizing roasting and introduced a new solvent in place of the expensive quicksilver, and a new plan for obtaining the silver in a separate condition. It is a fact long known to chemists, and I believe first noticed by Wetzler, who recorded it simply for its scientific value, that common salt when dissolved in water forms a fluid that has the power of taking chloride of silver into solution, a power that pure water does not possess in the slightest degree. The amount of chloride of silver that brine will take up, has been made a subject of investigation by modern experimenters, and it has been discovered to depend upon the quantity of salt present and the temperature. Thus at thirty-two degrees an almost insensible amount is dissolved, at fifty degrees 0.0017 of the weight of common salt present will be taken up, and at two hundred and twelve degrees its capacity has increased to 0.0068 of the salt in the mine. Upon this strange property of salt water rests the fact that the ocean is a vast reservoir of silver, containing, according to the careful experiments and calculations of French chemists, not less than 2,000,000 of tons of the precious metal. Upon this same strange property of salt water rests the metallurgic process introduced by Augustin. In outline it consists:

1st. In preparing the ore or product containing the silver, for roasting, by grinding it to a fine powder, and then subjecting this powder to treatment in a reverberatory furnace with an addition of common salt, by which means the silver is converted into a chloride.

2d. In dissolving the chloride of silver in the roasted ore by means of hot concentrated brine and conveying it in solution to proper vessels for precipitation. 3d. In precipitating the precious metal in the form of cement silver by the agency of metallic copper, and in refining the silver so produced, for the mint.

At Freiberg, in Saxony, where I had an opportunity of studying this method practically, it is employed for extracting silver from a rich copper matt, that is obtained from cupreous silver ores in the course of the peculiar treatment known as the "common lead smelting."

The cupola furnaces produce, beside the rich lead, which is sent to the process of cupelling, a sulphid of lead, iron, copper, silver, &c., which is concentrated by repeated fusions until most of the lead has been collected as rich lead, most of the iron passed into the slag, and a sulphid of copper, iron and silver obtained, which in the year 1859 contained an average of 69 per cent. of the first named metal, and 42-100 per cent. of the last.

This matt or regulus is broken into fragments by hand, and pounded to a fine powder beneath a series of heavy iron stamps put in motion by water power. It is now carefully sifted through a brass sieve containing two thousand apertures to the square inch, and is in a condition to be submitted to the process of roasting. The furnace is of the common reverberatory class, but much smaller than those used in Mansfield by Ziervogel. The fuel employed is stone coal, and one attendant is sufficient to carry on the work. Four hundred weight of mineral are placed on the hearth at once, and the fire gradually increased in strength while the attendant stirs continually, and occasionally turns the charge entirely in the furnace, that every part may be exposed to an intense heat. At the end of about eight hours the proofs of complete roasting begin to appear; the powder becomes brown and earthy, the heat does not produce that interior glow which is an evidence of the presence of sulphur, and no fumes of sulphurous acid are to be perceived. Then the contents of the furnace are drawn out, allowed to cool, and carried to a mill resembling that usually employed for grinding corn, and after being ground and bolted is brought back to the furnace to be subjected to the chlorizing roasting.

The copper and iron of the matt exist now partly in the form of sulphates, while the silver is present as a sulphate or in a metallic condition. The powder is placed in the same furnace, in charges of three hundred weight, and roasted for a short time, then mixed with five per cent. of common salt, and the heat and stirring continued for about three hours. During this time the chloride of sodium, or salt, is decomposed by the sulphuric acid of the sulphides, and the free chlorine thus formed combines with the silver, for which it has a strong affinity, until nearly, if not quite all of the valuable metal has taken the form of a chloride. The powder is now drawn from the furnace and carried in iron trays to the department devoted to lixiviation.

This is an elevated room containing a number of strongly made, round wooden vessels ranged in a manner similar to those at Wettstedt, which have already been described, in rows one above the other, so that the fluid poured in at the upper level will descend step by step to the bottom. Beside these vessels a large vat at a still higher level holds the store of hot brine, which is heated to the proper temperature by passing steam through it. Eight of the above mentioned tubs occupy the upper row, and in these the dissolving of the chloride of silver takes place. The powder, still warm from the furnace, is placed in each to the amount of six cwt., and the hot brine allowed to run in upon it. The fluid passing through the mineral mass comes in contact with the fine particles of chloride of silver, takes this compound into solution and carries it through a filter of linen and straw that forms a false bottom of the tub, and thence by troughs into two reservoirs, where the earthy particles mechanically suspended in the fluid are allowed to settle.

The process of lixiviation is continued for each tub of powdered mineral, until a bright copper plate, placed in the stream flowing through the filter shows no indications of a silver precipitate. The solution of the precious metal is now assumed to be as complete as possible for the present, and the contents of the tubs are assayed, that the amount of silver remaining may be determined, and that no loss from unperceived accidents in roasting or dissolving may occur. When more than 1-33 per cent. remains the powder is again sent to the furnace, roasted with salt, and subjected to another treatment with brine, as above described. If containing less than 1-33 of a per cent., which is generally the case, it is carried to the appropriate furnaces and fused for copper.

The argentiferous brine flowing from the lixiviating tubs, after being allowed to deposit the particles that may be held in mechanical suspension, passes into three tubs, each containing a layer of cement copper eight or ten inches deep. The superior attraction of copper for chlorine causes the silver to be precipitated in a regiline condition as cement silver, while the former metal is taken into solution in its place, and carried forward into a fourth range of tubs, where, in order that the complete precipitation of the silver may be

secured, the brine is brought the second time into contact with finely divided copper. A still lower range of tubs receives the fluid which now holds much copper in solution, and where, by means of metallic iron, the copper is in its turn precipitated in the form of cement copper.

The fluid passes into other vessels containing iron, that it may be completely freed from its copper, and then flows into a reservoir beneath the floor of the apartment, and is finally pumped into the reservoir spoken of in the commencement of the description, to be heated and passed again over the argentiferous powder.

The silver falling in the precipitation tubs is collected every eight or ten days, cleared of particles of copper by passing hydrochloric acid over it and placed in a vat where for a period of twenty or thirty days it is allowed to remain in pure water, which is occasionally renewed. It is then placed in an iron pan upon the top of the furnace and allowed to dry, and finally, it is carried to the refining department, where it is fused and purified for the Saxon mint.

Not only is the separation of the silver more complete than by the method of lixiviation formerly in use, but the copper obtained by smelting the lixiviated remainders is found to be much superior to that obtained by the ancient method, since during the complete roasting at the beginning of the process, a greater part of the antimony and arsenic are driven off into the atmosphere.

SILVER MINES OF THE UTAH MOUNTAINS.—This chain of mountains is remarkable for its valuable deposits of copper and iron ores, but is not specially interesting for silver. According to official tables prepared by Mr. Topleff, the average production of the Russian mines from 1829 to 1835, was about 21,000 kilogrammes of aniferous silver, annually.

SILVER MINES OF THE ALPS.—Compared with other silver-producing regions of Europe, this is of little importance. The mine of Allemont was worked from 1768 to 1815, and then abandoned. It yielded as much as 2,000 marcs of silver, annually. A mine of argentiferous gisela, called l'Argentierre, has recently been resumed in the High Alps.

CALIFORNIA.

Tulare county.—We take the following extracts from the late Visalia papers: The Delta says: Never, it seems to us, since the first settlement of this valley, have the prospects of a sure recompense for labor expended in farming, been so good as they are for the coming season. The rapid development of the mineral wealth in the Coso, Telescope and other silver districts, afford a certain assurance of the accumulation there, during the next summer, of a large population; and if common sense and a little energy prevail, in the way of road making, the miners there must receive their supplies from this valley. The Kern and White river quartz mines too are yielding well, and the population of that section is steadily increasing. The troubles in the old States will drive thousands of sturdy emigrants, mostly farmers of Virginia and the southwest, to seek an asylum within our peaceful borders. Most of these will settle on the unoccupied Government land in this section, and must be fed until they can raise a crop. These facts are sufficient we think without any elaborate argument, to convince farmers that four times the amount of wheat grown last season will not be any too much, in view of the increased demand. Other branches of farming, too, will prove very remunerative. Butter, cheese, honey, lard, eggs, etc., will from this time forth, command, as they do now, good prices; and there will be little excuse if the farmers are not out of debt by this time next year.

Amador county.—The Amador Dispatch says: The long heavy rains of the past two months have been exceedingly favorable to mining operations throughout the southern portion of the State. Water is now abundant, the ground in fine condition, and all endeavoring to profit by such unusually favorable circumstances. In our own county we hear none but the most cheering mining news, and notwithstanding the very prevalent belief that the placer diggings are worked out, our attention is almost daily called to the fact of a new strike having been made in some one of the mining camps. A fluming company near Fiddletown have taken out over three thousand dollars in the last three months. At the Gate three men, in one week, cleaned up four hundred and fifty dollars. On the middle fork of Jackson creek, two men have washed out \$5000 in a short time, and the claim in appearance at least is as good for as much more. At Tunnel Hill, miners are making from five to ten dollars a day to the hand. At Butte city there is yet two or three claims that are paying well. At Volcano and Laucha Plains, miners are doing unusually well, but we have no particulars.

Calaveras county.—The Calaveras Copper Mining company, after a year of prospecting and the expenditure of a large sum of money, have at last struck a vein of ore which bids fair to be very rich. We have a sample of the ore before us, which is about equally composed of red and black oxides. It will assay at least thirty-two per cent. of pure copper. The lode is represented to be about two feet in width. —[San Joaquin Republican.]

OREGON.

The Jacksonville Gazette says: On Sunday last, Mr. Avery and his partner, who owns a claim near Armstrong Gulch, on Jackson creek, dug out a solid lump of gold, weighing a trifle over two pounds and a half, and in the very next pan of dirt got out six ounces more of the same precious stuff. We saw the large nugget yesterday, and found it all it had been represented.

The rush for the Salmon River mines still continues. Parties leave the Dallas by every opportunity, and push on without regard to snow or any of the articles that usually retard men in the ordinary pursuits of life. The fact is the experience of this winter has demonstrated that there is no difficulty in reaching the mines at this season of the year. The great objection is that little or nothing can be done after the miner gets there. The water freezes in the rockers, and even by large fires and by pouring heated water into his rocker it is found that the miner can work but a few hours in each day. Very many have gone into the mines and after trying this work for a few days have been glad to come out again. Their place however is immediately supplied by new comers, who follow the same routine with a like result. The fact is that during the months of December, January and the early part of February nothing of any consequence can be done in the mines and those who go there at this season of the year, go with the certainty of encountering many hardships, with no prospect of good results. All those who have seen the elephant prefer to winter at the Halls or Walla Walla, and make early start in the spring. — All the old and experienced mountain men, without a solitary exception, agree in the opinion that the route via John Day and the Grande Ronde, is the most direct and practical way of reaching the Salmon river mines. — Jacob Wiser just from the Salmon mines, informs us that with eight days labor he took out of his claim with rockers upwards of \$20,000 in gold dust.

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc.
The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing. fcl6

PALTENGI & LARSENEUR.

Between Street [Old Nos. 130, 132; New Nos. 422, 424]

A. ROMAN & CO.

Booksellers, Importers, Publishers,

507 MONTGOMERY STREET,

SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 577 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 260 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc., Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Rudimentary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lane. Born.

The Discovery and Geognosy of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Disquisition on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every unengaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 29 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINERS.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of minerals, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor the "Mining and Scientific Press" of San Francisco. The title of the work is the "Miner's Companion and Guide, and treats of California Mines exclusive of it will prove a most valuable work for the prospector, miner, geologist, mineralogist and assayer: it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, and which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout our mining towns for its merit and lucidness. We earnestly commend it to those who are practically interested in bringing to light from Mother Earth the hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$4,520 3 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs Birdsall & Lott, amounted to the large sum of \$1,019,273 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For parting silver from gold when gold

is below 300-1000ths. fine. 3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight

301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge of 1/2 per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register as most congruous with the physical aspects of the material but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT. NOV. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this coast of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, 10th Marine and Stationary; Straight Quartz Mills of all sizes and shapes; Stamp Shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months; Blasting Pumps of all sizes and kinds; Flouring Mills; Gang, Job, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines has been in operation at McTeal's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now made.

Quartz Screens, of every degree of fineness, made of the best Russia Iron, or Wire and a Vee of all dimensions; Building Frames; Horse Powers; Nut Mills; Roller Fronts; Wind Mills, of Hunt's, Johnson's and Larr's Patent, and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Thankful to the public for their many past favors, we would respectfully ask a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GO DRAID & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour ter arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS
Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY
Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver aving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing half or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

DEVOE & CO.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IS CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munih & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM DON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the Inventors of the United States.

A MONSTER APPLE.

In the annexed cut, we have perfected an excellent likeness of the shape and peculiarities of a monster apple of the *Gloria mundi* species, grown on the banks of the Columbia River in Washington Territory, by Joel Knight Esq. The cut represents less than half its size, as the entire dimensions would have occupied too much of our space. The original was presented to the editor of the Oregon Farmer, with the following note; remarks by the same are also attached:

CLARK COUNTY, W. T., Nov. 11, 1861.

EDITOR Oregon Farmer—Please give the measurement and weight of this apple in the *Farmer*, if you consider it one of the big ones. It measured when taken from the tree, nineteen and a half inches in its largest circumference by seventeen and a half inches in its smallest.

Yours,

JOEL KNIGHT.

Accompanying the above note was the apple referred to. It is we believe the largest we have ever seen. It is of the "gloria mundi" variety, and weighs forty-five and a half ounces, or two pounds thirteen and a half ounces; sixteen of those would make a bushel, standard weight, forty-five pounds per bushel, with seven and a half ounces over. If any of the children of men grow larger apples than this, please pass them into our arms.—*Oregon Farmer*.

We are indebted to the enterprising firm of Knapp, Burrell & Co., No. 310 Washington street, for a cast in Plaster of Paris, of the apple above described. It was sent to our office, and filled a box measuring at least ten inches square. It has since been sent on its way to the World's Fair at London, where it will undoubtedly be an object of curiosity to thousands of visitors.

Now, having concluded a description of this fine specimen of the production of our prolific Pacific Coast, we may as well add that the Messrs. Knapp, Burrell & Co. are constantly receiving from their houses in Oregon and Washington Territory, tons of the same and other species of fruit; in fact they are supplying nearly the whole trade with fruits of the choicest kinds, being more extensively engaged in this business than any other house on this coast, which remark is equally applicable to their importations and trade of reapers, mowers, and farming implements of every description.

PONTOON BRIDGES.—The New York *Commercial's* Washington correspondent thus describes the method of constructing a pontoon bridge for the passage of an army over a river:

Pontoon boats are flat bottomed, thirty-one feet long, two and a half feet deep in the centre, two and a half feet wide at the square bow, and five feet at the stern, swelling out at the sides to the width of six feet. Each one fits on a running-gear of four wheels, and is used as a baggage wagon for the pontooniers, carrying also its proportion of string pieces and

of plank. On reaching a river the boats are unloaded, floated across by cables made fast up the stream, then the string-pieces are laid across from one boat to the next, and on these are placed the planks, each twenty-one feet long, which form the gangway of that width. It is a fine sight to see a regiment come to a river bank with a pontoon train—unload and launch their boats—moor them in a line, and in less than five minutes from the time when the word "halt" was given, have a bridge, say six hundred feet in length, over which an army can safely pass, with artillery and baggage.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to last purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefitted by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

UNION IRON WORKS (ESTABLISHED IN 1849.)

N. E. Cor. First and Mission streets, San Francisco.

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the last twelve years, during which time new and extensive Buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS, MACHINERY AND CASTINGS,

Of every description, on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Powers, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work, Steamboat Repairing and Blacksmithing, etc.
STEAM ENGINES BUILT AND REPAIRED.

Besides the extensive assortment of Machinery Patterns, attention is called to the new and beautiful designs for Building Castings, Iron Fronts, Columns for Stores, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, &c.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & G. M. WOODWARD'S PATENT.—This Pump is used for supplying Steam Boilers, Mills and Public Buildings, with water. In case of fire it is arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the discharge Outlet. It is suitable for both Maritime and Mining purposes, being used on nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED.
PETER DONAHUE, Proprietor.

OILS AND LAMPS BY LATE ARRIVALS.

STANFORD BROTHERS HAVE RECEIVED

A GREAT VARIETY OF COAL OIL LAMPS of every style of BURNER known to the trade.

BRACKET LAMPS AND SIDE LAMPS with the largest burners in use. PARLOR AND STAND LAMPS—An endless variety of Patterns. CHAMBER LAMPS AND HANDLE LAMPS—Very cheap; may be carried about.

CHANDILLERS AND LANTERNS. CAMPBELL LAMPS OF ALL KINDS. COAL OIL AND CAMPBELL WICKS. CHIMNEYS, SHADES, GLOBES—of every size, style and finish.

200 BARRELS SPERM OIL—At a lower price than ever before sold in this city.

100 BARRELS LARD OIL—Of our own importation.

600 TUBS RAPE SEED OIL—In original packages.

100 BARRELS BOILED LANSKED OIL—guaranteed pure and free from fish oils

400 CASES DOWNER'S KEROSENE.

800 CASES COAL OILS—At the very lowest market prices.

1,000 CASES CHINA OIL—In 2½ gal. tins.

We feel confident in assuring our CUSTOMERS and the TRADE generally, that they will find our assortment of LAMPS and LAMP STOCK, as well as of OILS and all kinds of BURNING MATERIALS, the most complete that has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms, and we are determined to fix our prices at a standard so low that dealers in our line of goods can lay in their Winter Stocks, and have a wider margin for profit than they have ever had before.

STANFORD BROTHERS,

SAN FRANCISCO, SATURDAY, JANUARY 11, 1862.

NO 17.

Washoe Correspondence.

GALENA, WASHOE CO., N. T.

ED. MINING AND SCIENTIFIC PRESS.—But few of your readers perhaps have any distinct recollection of such a place as this. Most of them I dare say will have to tax their recollection to determine exactly where Galena in Washoe county, Nevada Territory is. So rapidly are new places multiplied and new geographical divisions created here that it is difficult to keep posted in this respect. The springing up of towns and the formation of new counties and districts keep the chart changing like a kaleidoscope. It is but a little while since a new name—and a very objectionable one under the circumstances was given to our Territory—"Washoe County"—a name by the way that should have been applied to the Territory itself, was created by late act of the Legislature. This county lies along the eastern base of the Sierra Nevada, extending from Eagle Valley to Pyramid Lake, a distance of about sixty miles. Its width is about twenty miles, the California line being its western boundary; it therefore includes Washoe, Pleasant and Steamboat Valleys, and the Big Meadows of the Truckee, containing a larger proportion of good land than any other county in the Territory except Douglas, in which Carson Valley proper is situated. It has also more good timber than any other county, besides some very important mines, which were first found by Capt. White, of your city, early in 1860.

The ore found near the town is an argentiferous galena. The quantity of lead it contains is immense. Some of it has also a large percentage of copper.

A small smelting establishment was erected at this place early in 1860, by Mr. R. S. Hatch, it being the first work of the kind ever put up on this side the mountains. This gentleman, one of the most industrious and skillful metallurgists in the country, was very successful in his operations here; but owing to the abundant presence of antimonial and arsenical substances, in the rock reduced by him, he came near falling a victim to his assiduity. He has since perfected a process for saving both silver and gold, which is considered superior to anything yet brought out here, being employed with excellent results in eight of the leading mills in the Territory. It was first introduced at French's mill, and gradually extended to the above number as its merits became known, and I am of opinion it will soon find its way into many others.

But it was hardly of this, nor yet of the mines hereabouts that I set out to speak. As I have intimated, Galena is an obscure hamlet, and the precincts about but little known. While the newspapers are filled with descriptions of many other towns in the Territory, and with accounts of what is going on around them, scarce any allusion has ever been made to this place or its surroundings. Persons abroad will get some proper notion of the manner in which improvements are being pushed in Nevada, and the magnitude of its business when I recount the number and capacity of the mills—their cost and productiveness, in this same neighborhood, of which so little is known by the outside world.

Owing to the excellent timber and fine water power here,

the principal business carried on is that of lumbering. The first saw mill erected was that of Persons & Co., put up over a year ago. It is driven by both steam and water, and has a shingle mill attached. It is located on Galena creek, near the town—cost \$12,000, and has a capacity for cutting 26 M feet of lumber per day—running day and night, as do most of the mills here.

Chapin & Co.'s mill, a little higher up the creek—built last spring, is driven by water—cost \$8,000, employs fifteen hands, and cuts 15 M feet per day. Near Chapin's is the saw and quartz mill of Stiltson, Ramsey & Co., having a water wheel fifty feet in diameter, capable of driving a saw and twenty stamps. It cost \$20,000 and will crush eighteen tons of rock, and turn out ten M feet of lumber daily. Alford's saw mill, close to the town, built a year ago, is driven by water, and cuts 12 M feet of lumber per day. It is a substantial mill of thirty horse power, and cost six thousand dollars.

James' quartz mill, half a mile below the town, driven by water, has just commenced running. It is crushing rock brought from Virginia, and prospected ledges in this vicinity. It cost \$12,000; has a capacity of thirty horse power, runs fifteen stamps, and crushes about twelve tons per day. The number of stamps is soon to be increased. Johnson & Morton's Door and Window Manufactory, twenty horse water power, just completed and commenced running, cost \$10,800. It is doing a thrifty business, making pickets and laths from slabs and refuse lumber.

A little north of the town, on Brown's creek, is Prince & Brown's steam saw mill—cost \$8,000 and cutting 10 M feet daily.

Such are the industrial establishments now in operation in or immediately about this place, to say nothing of several others under way and soon to be completed. These mills which have cost in the aggregate over \$100,000, employ about twenty-five teams and two hundred men at good wages, rendering this one of the most active and thrifty towns in the Territory; and yet as I before remarked, scarce any one abroad ever heard of Galena, or perhaps ever would have done so but for this hasty and imperfect epistle, so apt are these out-of-the-way though really prosperous and important localities to be overlooked, in a country where the more enticing pursuit of mining is the leading interest.

Alloys of Cadmium.

By B. WOOD, M. D.

In a former communication (Journal of the Franklin Institute for August, 1860, page 113) I took occasion to speak in general terms of some of the properties of some cadmium as exhibited in combination with other metals, in order to draw attention to certain characteristics which appeared to have been overlooked heretofore. I now propose to speak of some of its specific combinations by way of illustrating its properties in particular connections. I confine myself to the results of my own experience.

These experiments were made at different periods, as occasion prompted, with a view to the production of alloys possessing properties suitable for particular uses. Although they cannot but fall short in value to what a more methodical investigation might have deduced, it is hoped they may not be altogether without interest.

Cadmium in its general characters, has a greater resemblance to tin than to other metals. It has less lustre, tarnishes more readily in the atmosphere, is considerably harder, and requires a higher heat for its fusion. It has a sort of milk-white glistening color, approaching a silver-white, with a blue tinge, somewhat like zinc. Its melting point is nearly the same as that of lead. At a low red heat it volatilizes giving off orange colored fumes: at a higher heat it flashes and detonates, and if the heat be still raised it bursts into flame with an explosion. It is perfectly malleable, and has considerable tenacity. In flexibility or toughness, or coherence of its particles, as indicated by flexion and torsion, it is inferior to tin, ranking with lead. It dissolves rapidly in nitric acid, is acted on feebly by muriatic acid, and very slightly by sulphuric acid. (Neither of the last named acids evince a perceptible action immediately: after remaining some hours in strong muriatic acid the metal became small bubbles (hydrogen) clinging to the surface, and a minute quantity of black particles being detached from it; immersing the same length of time in sulphuric acid, the surface of the metal was not perceptibly discolored, though slightly clouded, presenting a deadened appearance; no bubbles are visible).

It tarnishes at once in strong solution of caustic potash but the solvent action of this menstruum upon it appears to be very feeble.

Electrically, it is highly positive with respect to gold and silver. When pieces of gold and cadmium, placed on opposite sides of the tongue, are brought in contact in the usual method, a powerful galvanic action results, producing a remarkably pungent, disagreeable and persistent taste, with a sense of excoriation of the tongue and even lips. The impression produced by cadmium and silver in the same way, is also very pungent, but the taste is not so disagreeable.

With some metals cadmium appears to have little affinity; with others its affinity is very strong.

Its volatility renders its combination with the less fusible metals somewhat difficult under ordinary circumstances, although probably not in general more so than is the case with zinc.

Cadmium and copper have too little affinity to alloy well. It is difficult to make them unite by means of the blow-pipe; the process must be managed with care; it is generally attended with crackling and much volatilization of cadmium. If copper be used in excess, the alloy is likely to be porous or cavernous, presenting a spongy structure, owing to the retention of vaporized particles of cadmium which refused to enter into combination. On remelting the compound a portion of the cadmium volatilizes and extricates itself, bubbling up through the fused mass, and on this again cooling and solidifying, jagged protrusions break through the crust, like scoria. So, too, if brought to a red heat, though not melted, a portion of the cadmium oozes out and escapes in fumes. When, however, cadmium is in excess, the union is more intimate and perfect, the structure of the alloy being compact throughout.

Three parts (by weight) of cadmium and one part copper, form a white brittle alloy, of compact and homogeneous structure. It breaks like glass at the tap of the hammer, with a pearl-like fracture, presenting smooth glistening facets of a very clear white color, resembling very nearly the fractured surface of antimony, but surpassing it in brilliancy. Upon exposure to the atmosphere, its surface acquires a yellow tinge. It melts at a red heat, or at about the melting point of antimony.

One part cadmium one copper. A brittle yellowish-white alloy, breaks under a light blow with a granular fracture. Upon exposure the surface assumes a deep yellow color.

One cadmium, two to four copper. The metals in these proportions combine imperfectly under the blow-pipe. The compounds are brittle or but slightly malleable, and have a red copperish color.

Cadmium and platinum combine at a full red heat, with a

sort of explosion (?). It was difficult to form this alloy with a blowpipe. The cadmium fumed, crackled and hurred, in spite of any management: and when combination took place, the percussion was such as to blow the mass from the support. Melted in a crucible under borax, there was a slight detonation, but no combustion or fumes.

One cadmium, one platinum, form a hard brittle alloy, breaking at a tap of the hammer with a crystalline fracture, of a gray color, having a purplish tint resembling bismuth.

One cadmium, three platinum; similar to the last in character and appearance, but still more brittle, shattering to fragments under a slight blow. It has a clear gray color and a higher metallic lustre than the preceding.

Cadmium and nickel. With nickel I could not effect a combination, the metals appearing to have no affinity whatever, the cadmium burning away and the nickel not the least affected.

Tin and nickel under the same circumstances combine, forming an iron-gray brittle compound.

Cadmium and silver unite readily by the blowpipe, with little tendency on the part of the cadmium to volatilize; showing a strong affinity between the metals.

One cadmium, one silver (pure), form a gray-white alloy, of the color of platinum with a violet shade. It is very hard to the knife. It has a firm homogeneous texture. In hammering, it evinces considerable malleability, but is disposed to cleave under repeated blows. If annealed during the process it is highly malleable. When condensed by hammering it breaks easily, presenting a close-grained fracture; but when previously annealed it hears flexion back and forth nearly as well as copper.

Two cadmium, one silver. Very hard, superior to zinc in this respect. Color bluish-gray, similar to that of zinc, but has more lustre. Not malleable, cracking through the center with a coarse fracture.

One cadmium two silver. This is also a very hard alloy, apparently harder than the last mentioned. It has a yellowish-white color with a beautiful violet hue. It is perfectly malleable and has great tenacity. The difficulty with which it fuses is remarkable, particularly in view of the common theory as to the fusibility of alloys. Tested by the side of ordinary silver solder on silver plate, it did not melt under the heat which flowed the solder, and only when the silver began to melt. It is nearly tasteless.

Two cadmium three silver. Similar to the last in general characters, but in color approximates more to a true yellow.

Cadmium, silver and tin. Alloys consisting of one cadmium, two silver, four tin: and two cadmium, one silver and two tin, are hard, malleable, and possess considerable tenacity.

Cadmium and gold combine perfectly and with remarkable readiness. Properly managed the union takes place without hissing, crackling or detonation, (as I was led to anticipate from the cases of copper and platinum), and that the cadmium shows no disposition to escape by volatilization. The affinity of these metals is extraordinary. No sooner is the cadmium brought in contact with the melted gold than the metals seem literally to leap into each other's embrace, blending instantly into a homogeneous compound. Their compounds appear to fuse at a temperature less than the mean of the melting point of the constituents.

One cadmium two gold (pure), unite perfectly and with great facility, (as above described,) forming a splendid round button; color, white with a yellow tinge. Very hard to the knife. Not malleable, breaking through the center with a crystalline fracture.

The alloys with gold continue brittle until the cadmium is reduced to one-eighth part or less.

One cadmium, nine gold. This is of a greenish yellow or brass color. Very malleable if annealed during the process of hammering. In toughness or flexibility similar to copper. Its fusibility is nearly the same as ordinary eighteen carat gold.

Cadmium, gold, and silver. The addition of silver to the alloys of gold and cadmium increases their malleability, but diminishes their fusibility.

Equal parts of cadmium, copper and gold produce a silver-white brittle alloy, which cleaves asunder under a smart blow, presenting a granular fracture. It melts below a red heat, a little above the melting point of zinc, but below that of antimony.

Cadmium, gold, copper and silver. Silver added to combinations of cadmium, gold and copper, promotes tenacity and diminishes fusibility, but less decidedly than in the case of compounds of gold and cadmium. By varying the proportions of these four metals, the different variety of gold color may be imitated.

One cadmium, one copper, two silver, twenty gold, (finess twenty carats). A bright yellow gold color. Perfectly malleable. Much less fusible than ordinary twenty carat gold.

One cadmium, two copper, one silver, (twenty carat). Color nearly that of pure gold. Malleable. Somewhat more fusible than twenty carat gold.

One cadmium, one copper, two silver, twelve gold (eighteen carat). Very malleable. A rich yellow color. Similar in fusibility to the last.

Cadmium, copper and silver. It is curious to observe the rich and varied colors exhibited by the different combinations of these metals.

One cadmium, one copper, two silver. Combination takes place with facility. A very handsome alloy, compact in texture. Perfectly malleable and has great tenacity, resembling in these respects the alloy consisting of one part cadmium and two parts silver. Color, yellowish-white with a golden hue.

One cadmium, two copper, one silver. These proportions do not combine so readily as in the preceding case. In respect to malleability and tenacity, the alloy is somewhat inferior to the first named, and superior to the last. Color pale copperish-red or pink. An alloy of one cadmium, three copper, two silver, has a redder color, but it is very similar in other qualities.

Five cadmium, three copper, four silver. This is but slightly malleable. It possesses a fine lilac color.

Two cadmium, one copper, three silver. Perfectly malleable. Color, light violet.

Three cadmium, one copper, two silver. But slightly malleable. It has a rich violet color.

Thus it appears, by different proportions of these metals, we produce all the richer tints of the rainbow—the various combinations of violet, yellow, red. These alloys admit of a high polish, and doubtless, some of them would prove valuable substitutes for silver, for certain uses.

In these descriptions it has appeared necessary to deal with specific proportions, in a variety of forms. We cannot rely upon generalization, nor upon what is predicted by single instances, as to the behaviour and products of metals in combination with others. Descriptions not based upon any specific formula convey little or no positive information, and may lead into error. When but a single formula is given or, if, when none is given, we are to take equivalent proportions as being intended, the facts frequently show at every considerable departure on either side of the formula given or intended, results essentially different from those described.

ELECTION.—The following officers were elected for the year 1862, at the California Academy of Natural Sciences. President, Col. L. Bansom; Vice Presidents, Dr. Eckel, Rev. S. B. Bell; Corresponding Secretary, Dr. Wm. O. Ayres; Recording Secretary, Prof. Brewer (of the Geological Survey); Treasurer, Wm. Heffly; Librarian, Prof. Whitney; Curators—Paleontology, Mr. Gahh; Conchology, Dr. Trask; Zoology, Dr. Cooper; Mineralogy, Mr. Haaks; Entomology, Dr. Behr; Botany, Mr. H. Bloomer.

Opal.

Fire Opal is one of the most splendid varieties of Opal, and is readily distinguished by its rich hyacinth-red and wine-yellow tints. From Xinapan, Mexico, are brought the most brilliant specimens, where it was first discovered by Humboldt. It occurs, also, in the same localities as the Precious Opal, but is a rare mineral. A magnificent suite of specimens is deposited in the cases of the British Museum. There is also found a glassy colorless variety of this mineral, in the same localities.

Wood Opal.—This is a truly interesting substance, as it becomes evident on inspection that what is now a mineral substance formerly belonged to the vegetable kingdom. In Wood opal may be clearly seen the concentric rings which indicate the age of a tree, as also what are termed by botanists the *medullary rays* of vegetable tissue, but, by some means, the whole mass has become impregnated with Silica, and presents all the characters of Opal. It occurs in Transylvania, Antigua, and Hungary; but the most beautiful specimens, of many different colors, are found in Van Diemen's Land, where whole forests of large trees have become thus petrified. To the geologist we must look for an explanation of this extraordinary phenomenon.

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by

parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH,
SAN FRANCISCO.

N. B.—R.W. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will hereafter transact all business pertaining to patents for us, at the patent office in Washington city. For instructions and the new law regulating patents, we refer the inventor to the above.

Miners, Inventors, Agriculturalists, Capitalist and Mechanics, will find it to their advantage to subscribe for the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of this above journal can be had on application, also any back numbers.

Coal.

Imports from January 1st to September 15:	
Anthracite, tons.	16,903
Chumberland cks.	1,144
English, tons.	14,165
Chili, tons.	9,135
Sydney, tons.	11,304
Japanese tons.	25
Vancouver L. tons.	4,536
Coast, tons.	11,384

The sales of 3000 tons Anthracite, to arrive, which occurred some little time since, and were not made public, are the only transactions of moment which have come to our knowledge. They were effected at \$18 @ 19 1/2 ton, with some slight resales at \$20. Our quotations give a true index of the market.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

Mining Companies and Associations.

OFFICE DIOS PADRE Gold and Silver Mining Company, 215 Front street, San Francisco, September 25, 1861.—Notice is hereby given that an assessment of one dollar per share on the capital stock of this company, was levied this day to be paid in installments at the office of the company as follows: Twenty-five cents per share, on or before the 29th inst.; twenty-five cents per share on or before the 28th October proximo, and fifty cents per share, on or before the 28th of Nov., 1861.

Shareholders will take notice that delinquent stock will be proceeded against in strict conformity to law.

By order of the Board of Trustees.

JOS. P. NORTSE, Sec'y.

OFFICE CHOLLER Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the Stockholders of this Company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

BY 23

W. E. DEAN,
Sec'y Choller S. M. Co.

OFFICE OF THE SUCOR Gold and Silver Mining Company, Nos. 1 and 2, Montgomery Block, San Francisco, California.—Notice is hereby given that the annual meeting of the Stockholders of the Sucker Gold and Silver Mining Co., will be held at the office of the Company, Nos. 1 and 2 Montgomery Block, on the first Monday after the first Tuesday of January, A. D. 1862, at ten o'clock A. M. of that day, for the election of Trustees, and for the transaction of other business.

By order of the Trustees.

R. H. WALLER, Secretary.

OFFICE OF THE (RUSS DISTRICT) Union Gold and Silver Mining Company, San Francisco, Dec. 13th, 1861.—The stockholders are hereby notified that an assessment of ten cents per share on the capital stock of the Union Gold and Silver Mining Company was levied on the 12th inst., payable on or before the 15th of January, 1862, at the office of the company, 410 Montgomery street.

By order of the Board.

C. J. HIGGINS, Sec'y.

Notice is hereby given that an assessment of One Dollar per foot (share) has this day been levied on the ground of the Alhambra Mining company, payable at the office of the company, 815 Sansome street, San Francisco.

By order of the Trustees.

J. O. STRAUCH, Secretary.

November 24th, 1861.

OFFICE OF SUCOR Gold and Silver Mining Company.—Notice is hereby given that the Board of Trustees of this company (formerly the Sucker company, Gold Hill District.) have this day, Tuesday, Nov. 19, 1861, duly levied an assessment of fifty cents upon each share or foot of the capital stock, or of ownership in, said company, payable immediately to the Secretary, at their office, Nos 1 and 2 Montgomery Block, San Francisco, or to J. A. Hobart, Trustee at Gold Hill, Nevada Territory. On default of payment of which assessment for thirty days after publication of this notice, all delinquent stock and ownership will be sold according to law, and the rules and By-laws of the company.

R. H. WALLER, Sec'y.

POSTPONEMENT OF SALE.—Delinquent stockholders of the Uuelo Sam company, Flomery Mining District, are hereby notified that the sale of delinquent stock advertised to be sold on November 16th, has been postponed until Monday, the 18th inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at 1 P. M.

By order of the Trustees.

JOHN G. CHRIST, Sec'y.

A MEETING of the shareholders of the Summit company will be held at the Gold Hill Bakery, in Gold Hill, on Friday, Nov. 16th, at 7 o'clock P. M. Punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.

JOHN WATKINS.

OFFICE HILLION Gold and Silver Mining Company, Van Horn District, 305 Montgomery street, San Francisco. Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock P. M.

T. L. RIBBINS, Sec'y.

SAVAGE Gold and Silver Mining Company. A meeting of the stockholders in the above company will be held at 10 o'clock, A. M., the 14th day of December 1861, at the office of Lent, Sherwood & Co. in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Morrow at Virginia City, or to A. K. Head Nevada; or the undersigned before the 14th day of December next.

WM. M. LENT, President.

San Francisco, November 27, 1861.

NOTICE.—There will be a meeting of the Sides Gold and Silver Mining company, on Sunday, November 17th, 1861, at 11 o'clock A. M., at the house of M. H. Bryan, Virginia City.

A punctual attendance is requested, as business of importance will come before the meeting.

Nov 29

M. H. BRYAN, Sec'y.

SHAREHOLDERS of the Osceola Gold and Silver Mining company are hereby notified that the meeting of the Trustees of said company in Virginia City, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to H. B. Russell, Virginia City.

Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Laddington & Russell, in Virginia City, on Saturday, the 10th day of December next, between the hours of twelve and three P. M.

J. S. WATKINS, Treasurer, Osceola G. & S. M. Co.

Virginia City, Nov. 2, 1861.

OFFICE OPHIR Silver Mining Company, San Francisco, Nov. 26th, 1861.—The Annual meeting of the Stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 11 o'clock, A. M., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

JAS. W. WHITE, Sec'y

NOTICE is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia City, N. T., on Saturday the 23rd inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

R. T. SMITH,
President Arizona Company.

NOTICE.—Notice is hereby given, that Jos. J. DuRat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mina Rica," "Guasaba," "Fortune," "Santa Cruz," and "Nacament," situated near San Antonio, Lower California, Mexico.

CHAS. J. DU RAT,
EM. LEYLA,
DU PRAT, SCHWITZ & CO.,
CHAS. KRAFT & CO.,
La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California.

For further particulars respecting the above named mines, inquire of
JOS. J. DU RAT,
428 Washington street.

GOLD HILL, TENNESSEE.—The meeting called for Saturday, November 9th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the saloon of Webb & Coppers, Gold Hill.

A punctual attendance is requested, as business of importance will come before the meeting.

ROBERT APPLE, Sec'y.

SHAREHOLDERS of the Caledonia Gold and Silver Mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 26th inst., to the Superintendent, at his office in Gold Hill, or to WM. B. AGARRI, San Francisco.

Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 9th day of December next.

By order of the Board of Trustees,

Gold Hill, Nov. 4th, 1861.

POSTPONEMENT OF SALE.—The sale of mining ground, at Silver City, by the Kansas Mining company, is postponed until four o'clock, P. M., Tuesday, Nov. 19th, 1861. Sale to take place on the grounds of the company. Delinquents will please take notice and "come to time."

By order of the Board of Trustees.

R. C. CHAPPELL, Sec'y

Virginia City, Nov. 9th, 1861.

TODAS SANTOS COMPANY.—The members of the Todas Santos Company are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary on demand. Also that the several interests of the members, who fail to pay their said assessments, on or before the 16th day of November, instant, or so much thereof as may be necessary to pay said assessments, together with cost of advertisement and sale, will be sold at public auction to the highest bidder, on Wednesday, Nov. 20th, 1861, in front of the office of John Kelly, on B street, in Virginia.

By order of the Board of Directors.

L. W. FERRIS, Sec'y

GOLDEN GATE COMPANY, GOLD HILL DISTRICT.—A meeting of the shareholders in the above named company will be held at the office of H. O. Gaylord, in Virginia on Saturday, Nov. 16th, at 7 P. M.

By order.

T. A. MONKHOUSE, Sec'y.

MEMBERS of the Senator company, Congress Lodge, Devil's Gate District, are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

L. W. FERRIS, Sec'y.

OFFICE OF THE DESERT Mining company, 509 Montgomery street, San Francisco, Nov. 24th, 1861.—The stockholders are hereby notified that an assessment of one dollar per share on the capital stock of the Desert Mining company, has this day been levied, payable on or before the 28th day of Dec. next, at the office as above.

By order of the Board of Trustees.

J. H. LYON, Sec'y.

NOTICE.—The regular annual meeting of the stockholders of the Cedar Hill Tunnel and Mining Company, will be held at the office of the Secretary, on Thursday, January 24, 1862, at 7 o'clock, P. M., for the election of officers for the ensuing year, and such other business as may come before the meeting.

San Francisco, December 24, 1861.

C. L. FARRINGTON, Sec'y.

ST. LOUIS Gold and Silver Mining Company.—Notice is hereby given that the Board of Trustees of the St. Louis Gold and Silver Mining company have, this 15th day of October, 1861, levied an assessment (for completing their mill) of two dollars upon each share of the capital stock of said company, payable to the Secretary, at No. 40, Montgomery Block, San Francisco By order of the Board of Trustees.

J. H. BREWER, Secretary.

OFFICE OF THE COLE Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cole Silver Mining company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.

J. B. COFFIN, Sec'y.

OFFICE DIOS PADRE Gold and Silver Mining Company, 215 Front street, San Francisco, October 20th, 1861.—A meeting of the stockholders of the Dios Padre Gold and Silver Mining company, be held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting, by order of the Board of Trustees.

JOS. P. NORTSE, Secretary.

OFFICE ROGERS' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of twenty-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees.

JOEL F. LIGHTNER, Secretary.

OFFICE GOLD & CURRY Silver Mining Company.—November 6th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WADSWORTH, Secretary.

OFFICE OF THE GOLD and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which was made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HIGGINS, Secretary.

OFFICE CROWN POINT Gold and Silver Mining Company, 321 Front st., San Francisco, Oct. 23th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

OFFICE CROWN POINT Gold and Silver Mining Company, 321 Front street, San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 10th of December next, at the office, as above.

J. H. JONES, Sec'y.

OFFICE SIERRA NEVADA Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 23th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City, or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary.

OFFICE OF THE GREAT REPUBLIC Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.

All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOSH. S. HENSHAW, Sec'y.

OFFICE OF GREAT REPUBLIC Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty sixty or ninety days from date, to the Treasurer of the company.

By order of the Board of Trustees.

JOSH. S. HENSHAW.

NOTICE.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees.

HENRY S. HUDSON, Sec'y.

San Francisco, Nov. 8, 1861.

OFFICE SIERRA Silver Mining Company.—At the Annual Meeting of the Stockholders, held Monday evening, December 9th, 1861, the following gentlemen were elected Trustees to serve for the ensuing year: H. Culver, Daniel Norcross, Jr. D. Conroy, in on Chap. Culbin Taylor, R. R. Noblett, T. J. Purbee, Isaac Tabor, E. Baker, Henry Palmer.

DANIEL NORCROSS, Sec'y. S. S. M. Co.

AT a meeting of the Board of Trustees, held Thursday evening, Dec. 12, 1861, the following officers were elected to serve for the ensuing year.

F. D. CONROY, President.

W. H. CULVER, Treasurer.

DANIEL NORCROSS, Secretary.

D. NORCROSS, Sec'y.

AT a meeting of the Board of Trustees, held Thursday evening, Dec. 12, 1861, an assessment of \$1 per share was levied, payable at the office of the Secretary.

D. NORCROSS, Sec'y.

144 Sacramento street.

NOTICE.—The annual meeting of the Charles Cany mining company, will be held at the office of the company (D. Davidson's room, northeast corner of California and Montgomery street, San Francisco) on Friday Dec. 27th, A. D. 1861, at 3 o'clock P. M. of that day, for the election of officers for the ensuing year, and transaction of such other business as may be presented. A punctual attendance of all stockholders is requested.

By order of the Board.

ALEX. FLY, President.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....JAN. 11, 1862.

The MINING AND SCIENTIFIC PRESS published is at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEROTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOE WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

Mr. Jerome B. Walker will from this date deliver the Press to subscribers in this city; he will also attend to the collection of bills and solicit advertisements.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr. Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstances have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

The Necessity of a Geological and Mining School.

The time is at hand, and the Pacific States, whose chief resources are its auriferous wealth, require not only a consistent code of laws, but also an institute for the diffusion of knowledge in this branch of Science, whereby the miner, engineer and prospector may be drilled in the art to prosecute mining in all its bearings. If we claim to be a progressive people, and would benefit by the experience of other countries, our authorities would not fail in establishing such an institute. We can count now thousands of sad accidents which may be laid at the door of negligent and inexperienced persons employed in mining, and for the want of some laws and regulations as exists in other mining countries.

We know nothing as yet what the State Geologist, Prof. Whitney, will do in these premises. In a lecture read by him last year he hinted to the Legislature of these subjects, the necessity of such an institute, and the passing of mining regulations for this State. It is now particularly incumbent upon the Committee on mining interests to draft bills for these essential purposes. In drafting such bills care should be taken to make such laws effective and binding upon interested parties, and beneficial to after generations—vide: German, English, Mexican, Spanish and other laws governing such affairs. Should our services be acceptable to this committee we freely offer them, free of charge in the framing of such laws, together with our library and works upon mining laws.

In the preparation of a bill pertaining to the erection of an institute for geological and mining pursuits, sufficient practical members exist in the Legislature to frame such, and the manner how its expenses shall be raised or devoted. We care not, nor is it material to the people of this State, how the appropriation shall be effected, when we assert that such a school is one of our utmost wants. Every branch therein should have its separate lecturer or teacher, and if we have not sufficient scientific men here, capable men should be sent for from abroad. We have heretofore advocated these leading subjects for the special advancement of our Pacific States, and many of our contemporaries agree with us. We trust sincerely that the Legislature now in session will give it due consideration.

The International Exhibition of 1862.

From a circular before us, emanating from the Executive Committee at Washington, we learn that this mammoth affair will begin on the first day of May next. Thus far California has done nothing, nor is it likely that much can be expected from us. The floods throughout the interior made serious havoc in every branch of industry.

Our State mineralogical collection, of nearly one hundred and forty cases, ought to be shipped "instantly." The Governor and Legislature have it in their power to commission at least one person to go on to London.

State Geological Survey.

We called in yesterday to see Prof. J. D. Whitney. He informed us that he transmitted a synopsis of a report for the year ending, of his labors to the Legislature. We are anxiously awaiting the publication of such a report as we know it will prove interesting and important to the people of this State. Authentic maps, splendidly drawn and colored, a series of them of California districts, are being completed under the direction of the Geologist, which we hope will be ordered printed forthwith.

Colonial Mining Journal, Melbourne, Australia.

This valuable exchange comes to us this week after a lapse of more than four months. We were indeed much pleased with its appearance in our sanctum. It is deplorable that our postal arrangements between California and these colonies are thus far and few between.

The late issues of the above journal contain some of the most interesting matters pertaining to the Australian gold fields, a number of splendid diagrams and illustrations of mining districts, and new inventions, exhibiting considerable talent and enterprise on the part of its publishers and proprietors. A short while since, the possibility of a steam line between those States and Australia was actively discussed; nothing has thus far transpired to verify such a fact. We are confident such an undertaking would greatly tend to the advantages in commercial or other pursuits to the managers.

We have now regular communication by steamer to Japan and the Sandwich Islands, and sooner or later we may be in communication with China, and why not Australia?

Ed. The Marysville Appeal acknowledges the receipt of some interesting photographic illustrations of some important mining claims in Nevada. The artist is Mr. A. Liebert of that place; and the photographs are said to be excellently well executed.

We have often solicited the illustrations of such matters by dint of wood engravings, and would only be too happy to do so, if any of our mountain artists would send us such copies of photographs. Our exchange says of the above pictures: "We have seen no finer photographs anywhere. Those of the Eureka claims are particularly good. These claims, famous for the richness of their yields and the systematic manner in which they are worked, are wrought by the hydraulic process, which the views of Mr. Liebert represent in full operation. The chasm in the hill is about one hundred and fifty feet deep. The views show the perpendicular gravel bank frowning blackly over this chasm, while at the base of the bank the live water leaps in horizontal lines, white and irresistible, dashing showers of spray in every direction, from several lengths of hose. The hose is fed by two large iron pipes, which convey the water from a flume at the top of the lofty bank to its base. Men stand at the end of each length of hose, directing the pipe and watching the bank with apprehensive looks, as well they may, for in these diggings four poor fellows have had life crushed out by sudden slides or tumblings of the earthen wall. The water cuts into the bottom of this wall till the weight of the mass above causes it to crumble down, when the water floats it off through wooden sluices to a shaft sunk in the bed-rock and connecting with a tunnel. In this tunnel, which pierces the rim-rock, other sluices are laid for several hundred feet, and convey the dissolved earth, catching the gold from it meanwhile, to the channel of the middle Yuba, eight hundred feet below the brow of the hill.—These views convey a vivid idea of the grandeur and effectiveness of the hydraulic process, and are better for that purpose than pages of description. Mr. Liebert has sold numbers of them, and all of his mining views are in demand with those who desire striking mementoes of the interesting scenery of the gold diggings.

Regular Correspondence.

COULTERVILLE, Dec. 28.

MR. EDITOR.—We have had a very severe rain here, and are somewhat excited as we have not been able to receive our daily news this week, and deeply regret the havoc the high water has made and is still making on the rivers. The creek that runs close by this village has done us but little damage; it has flooded a part of the village, carried away two small cabins, and destroyed a vegetable garden. It has also carried the bridge belonging to Mr. Wyatt, on the Merced, down the river, also destroyed property of Mr. Johnson to the amount of about two thousand five hundred dollars, on the Merced, by carrying away the flume and injuring quartz mills.

Splendid Castings.

Mr. Torquet, of the Vulcan Foundry, exhibited to us a few days since, a pair of 7x1½ feet cast-iron cylinders, for the Oregon Steam Navigation Company. They are by far the handsomest piece of casting we have seen for many a year.

At the Pacific Foundry the busy hum never ceases. Fletcher's Steam Ditcher is progressing and will soon steam from its place of creation. It is a gigantic looking implement; it will cost nearly six thousand dollars; it is thirty feet long; a perpendicular engine, with smokestack reaching a height of sixteen feet.

Coffey & Risdon, the boiler makers, are constructing an immense pair of boilers with all the latest improvements for the new boat, that is in course of erection for the California Steam Navigation Company.

At the Union Iron Works, Coleman's quartz mills are being rapidly put up; a great demand has been occasioned since his great improvements have been effected.

SUMMARY OF MINING NEWS.

To Miners and Mill Owners.

We respectfully request all persons interested in the Mines, Quartz Mills, or in any prospecting expedition; also the Recorders of the different mining districts to forward to us at all times, such information concerning the condition etc., of the mines and hills in their vicinity, and description of localities, as they may think will prove interesting or useful to be public, for publication. Recorders of mining districts will oblige by sending us their address.

CALIFORNIA.

Mariposa county.

ED. MINING AND SCIENTIFIC PRESS.—Business is quite dull here at present, a account of the scarcity of water, which will not be the case hereafter, as we are having an abundance of rain this time. It has rained for one week, and still it rains, and we fear it will do great damage throughout the whole country, especially on the rivers, which we fear has already overflowed, as we have not been able to get our mail for six days, and if it continues much longer we shall be cut off from all communication for weeks. The miners in this section of the county will be greatly benefited by this rain, and we expect business will be very brisk. If it was not that all, or a great portion of this county, was owned by one individual, Fremont's grant, would be, I might say, without any exception, the best and richest county the Pacific Coast.

The placer mines are good to this present day. The ground that is being worked by Americans is paying them well. The principal portion of the miners are Chinese, as they are the favorites on this grant, and fare in one respect much better than the white man; on every month's work that an American does in the mines he has to pay four dollars as a tax, and for the same length of time a Chinaman has only to pay three dollars. It is wrong at such a thing should exist, and is the means of driving many a good miner from this place.

Quartz mining is prosecuted on a very large scale on this Fremont's grant, under the charge of T. W. Parks, all of which is paying well. The "Lentons," which is situated on the Merced river is running forty-eight stamps and crushes about one hundred tons of rock per day. There is a mill or other mills not quite as large, which are crushing somewhat better rock; one known as the Princeton is supplied from a lead close by; this mill crushing rock at the present time which is paying from thirty to forty dollars per ton.

Trinity county.—The Journal brings us the following items: From a correspondent over the signature of "Salmon," we are informed of the late freshet in the clean sweep along the Salmon river, of nearly everything that remained unharmed from the first and second. Great fears are entertained of the destruction of Mrs. Morris' Hotel, which barely escaped the flood. All night the banks of the river were glittering with lights as men were looking after their property. Several houses at Clatskanie (Stewart's Flats) were washed away, obliging the inhabitants to take the mountain side, and there remain in a dangerous position. An immense slide of earth and rock came down from the mountain on the east side of White's gulch, filling up the gulch and damming up the water. The slide was about 10 miles in length and about three hundred yards in width. At this point large bodies of water accumulated, and when it broke through it swept low trees and every obstacle in its course. The quartz mill of Baggett & Co., on this gulch, sustained great loss in part of the machinery washing away, and a large tree falling across the highway, crushing the horses to atoms. The cost of the mill was about six thousand dollars and it was a total loss. The stockbridge, rastra and apparatuses were also washed away with a loss of nearly five thousand dollars. The whole gulch is completely wiped out, in fact it is a sight to behold, slide after slide having come down from the mountains, and carried down the stream. Citizens go up to witness the scene daily. The rush from this gulch was the cause of the Salmon river rising so suddenly. The trails between Sawyer's and the mouth of the Salmon are impassable, on account of the slides making precipices where trails had been. On the South Salmon, immense damage was also done. Fitzsimmons & Co., are now repairing their large lumber, and will have in running order in two or three weeks, which will furnish plenty of war for some of the best mining claims in Northern California. Good diggings are anticipated on White's gulch. The entire damage on this river is estimated at \$90,000.

The Trinity Journal says new diggings are being struck in gulches never before worked. On Line Kila gulch, near the Forrest House, Mr. Handy struck up from the surface of the ground a piece of gold weighing eleven flasks. A large amount of ground has been sluiced out of the gulch by late storms. Several persons are staking out claims.

Mono County.—Recent correspondence from this mining region speak of the climate as being very tickle, ranging between extremes of heat and cold, sunshine and storm, in a very short period. About Christmas a warm in spoiled good sleighing, for the second time this winter. Four feet of snow fell at Monoville, breaking down a number of houses, and driving miners away. The town is located high up in the Sierra Nevada. Aurora, the county site, is situated in a milder region, where fire-wood is plentiful \$5 per cord, less than half what it hangs in Washoe. Coal indications have been found. Many persons are monopolizing large quantities of forest land for the timber. Aurora now boasts ten or twelve fire-proof buildings, there are seven quartz mills in operation, and four more being built. Those work crush from five to ten tons of rock per day each, yielding an aggregate product of \$1,000 daily. The rock here gives from \$35 to \$150 to the ton. Three of the mills now work the ore for the silver, effecting a great saving thereby. They are all making money, and cannot fail to encourage a creation of many additional mills in the spring.

Calaveras county.—The Calaveras Chronicle mentions that William Ryer, the discoverer of the rich vein of copper running through the rim of the Calaveras company, reports that the lode is increasing in width and the ore improving in quality. At an altitude of one hundred feet, the ore twenty-two feet from the surface, is yielding shipping ore, a portion which assays eighty-five per cent. of copper. The ore contains a large portion of the red oxide, and in its general character, bears a close resemblance to that produced by the celebrated Burra Burra mine of Australia.

Amador county.—Marlette & Co.'s quartz mill has been stopped the week in consequence of a portion of the ditch that supplies the mill being broken by the late rains. The water in the shaft is so much that it requires constant bailing.

El Dorado county.—James Smith & Co. cleaned up near Grizzly, recently, one pound and a half of gold from two week's work.

Battle county.—The Battle Record says the largest nugget of gold ever found in that county, worth \$394, was recently taken from a claim at Mountain Cottage.

HUMBOLDT DISTRICT.

A correspondent of the "Silver Age,"—Carson, writes as follows: Having now looked about this region for a short time and dotted down a few facts and made some observations, I send you the result. The quartz veins are all being developed, though slowly, for want of means, and new lodes are being discovered almost daily. In the Humboldt District some

of the lodes have been extensively worked. The Cuba has a tunnel into the ledge, and have struck the rock. It is almost similar to the Comstock ledge, and parties here from Virginia think it equally as rich. The Payne, Hunt, and Bonnell and Humboldt lodes, have also been tunneled, and the work on them is going forward fast. The Bonnell is a very handsome ledge, cropping out a width of forty feet, and full fifteen feet high. The Canada, California, Crittenden, Melrose, Winnemucca, Louisiana, Lone Star and Washington are also fine ledges, and bid fair to rival the best leads in the Territory. In the Prince Royal District there are many fine leads, and among them are the Prince Royal, King, Queen, Red Oxide, Lincoln and Louis Napoleon. The Santa Clara District is also full of rich veins, the others that have not yet been visited this district, but have heard of the Explorer and Wyoming ledges mentioned as being among the best. The Star District contains, among others, the St. Bernard, the Mountain Luck, Maggie, Highland, Mammoth, Shela, Franklin, Alamo, Yellow Jacket and Skyron. In the Binea Vista District is the Governor Downey, rich in gold; the Alba Nueva, Congress and Golden Eagle. This rock has assayed \$300 to the ton in silver. In this District are also the El Roy, Cass, Mary Belle and Mary Ann. In the Indian District the Bell has assayed \$200 in gold and \$1,000 in silver to the ton. The Red Hawk and Moon Light are also rich. The Sacramento District I have not yet heard from. The Recorder, Dr. Brown, is now in Virginia.

In the Echo District, the leads best known are the Mason and Dixon, Seal, Rattlesnake, Wolfstone, Stewart, Atlantic, Constitution, Lafayette and Great Eastern. This last ledge has not been fully examined, but the richest discovered in this district is said to be in it.

The Central District also, and many leads have been discovered that will be opened in the spring.

The Chamber District and ledges were discovered and the District formed by Geo. Reisser. The principal ledges are the Lincoln, Buckeye, Union and Hardacreable.

There are many other leads discovered in these Districts than I have mentioned.

The already five quartz mills contracted for in California, to be put up here early in the spring.

Our County surveyor, Mr. Epler, started yesterday, with a party, to go some forty miles up the Humboldt river, to make a survey and ascertain the expense of ditching and turning the river, so as to bring it into this canon. This will, no doubt, be done.

The weather is very pleasant here, there being neither snow or frost.

Two men were severely wounded on Saturday last, while firing a blast in the Cuba tunnel.

Yours, etc., G. T. S.

Says the "Enterprise."—Mr. Hurst, who brought some rock a short time since from Star District, left town a few days since with teams to bring in another load. The ore is taken from the Shela vein, in Star Canon, and the former led yielded very rich. Eight or ten tons will be shipped, and it is calculated will reach here in about three weeks. It will be crushed at Graves' mill, and reduced by the Vetch process.

COLORADO TERRITORY.—According to the "Rocky Mountain News" (published at Denver, Colorado Territory), the Santa Fe mines are really valuable. They are situated at the foot of the main snowy range in Eastern New Mexico, which rises to a great height above them. The leads of auriferous quartz are abundant and rich. Placer diggings exist in patches here and there. They contain considerable coarse gold, and would be productive if water were not so scarce as it is. There is one quartz mill crushing rock from these ledges, and doing well. It obtains water, twelve feet deep. The gold procured is worth \$10 to \$20 per ounce. The climate of Santa Fe is described as mild and pleasant.

The "Appeal," in speaking of the above mines, says:—Since these mines were swallowed up in Colorado Territory, to which they gave birth, we hear less from them than formerly. It is gratifying to know that they are extensive and lasting, and constitute a sure basis of rapid and prosperous territorial and State growth. One remarkable feature in them is the very high proportion of quartz ledges over placer diggings. This feature will give more stability to the chief industrial interest of the Territory, besides creating a diversity of pursuits by the heavy demand it makes upon mechanical labor of all kinds. The Denver "News" of Dec. 7th, speaks of the mines as follows:—Accounts from all parts of the mining region are most flattering. Although the aggregate number of men engaged in mining is not larger than last winter, the yield of gold is undoubtedly much greater. The approach of winter has of course interfered with the operations of many in the gulches and river diggings, but lead mining is steadily increasing. The mills that are running—a large majority of all in the country—we believe are invariably paying well. The old fully of running expensive machinery for weeks and months without realizing anything therefrom, is no longer practiced. A quartz mill is now an operation engaged in mining, for to presume that it is making money—more or less—intimately more than expenses. Mill men are gradually learning their business. It takes time to become proficient in anything, but we believe our Rocky Mountain miners are learning as fast as any new business ever was learned by any community of men. The quartz region is rapidly expanding, and will, ere long, be co-extensive with the gulch diggings."

MEXICO.

REALITO, SONORA, Oct. 22d, 1861.

ED. MINING AND SCIENTIFIC PRESS.—I have written to you twice since my arrival in this country, and should have done so much oftener, but I am living away up in the mountains, and have but few opportunities of sending letters to Guaymas, for there is no mail communication, and it is only once in a week's age that there is any one traveling on the road; for the people are so afraid of the Indians, that they never leave home unless compelled to do so. Between the Indians and the church party the country is in a state of war. It is a rough country to live in I assure you. If a person gets "jerked beef" and "tortens" enough to live on, he is in good luck; and if the Ladrones or Indians do not get his scalp he may consider his life a charmed one. In regard to the people here the less said the better, that is the men; the majority of them are the most debased, lying, thieving and treacherous beings on earth; the women are just the opposite; never have I seen kinder hearted, more generous or hospitable women in my life. They seem to look upon Americans as supreme beings.

A short time since I was confined to my bed for several weeks, with a severe spell of sickness, and had I been amongst my own family I could not have been treated with more kindness.

In regard to mining, I think the silver mines here are ahead of any country in the world; copper and lead also abound; but the gold mines, that is in this section of country, are worked out. I am perfectly satisfied though, that on the head waters of this river there are rich and extensive placer diggings; but the country is inhabited by Apache Indians, and they will not allow any one to work there. It would take at least one hundred well armed men to go amongst them. I would advise you to come here unless he has some money, and is well armed. A man cannot make grub here by daily labor. It is true there are any amount of rich silver mines, but it takes a little money to work them, and also time to become acquainted with the people and country.

Don't think from the manner in which I write that I am disgusted with the country,—no, far from it; I expect to reside here until I make my pile; but I merely state that, in regard to the country I know to be true. I am interested in a silver mine which is considered one of the richest in the Territory. I have received several of your most valuable papers, and allow me to return to you my most heartfelt thanks for your kindness in sending them to me. After they are read through they are carefully filed away. There is nothing we consider so much a treat as the reception of a batch of newspapers. With my best wishes for the success and prosperity of your valuable paper, I remain sir, your sincere friend and well wisher,

A. E. HENDREE.

Photographs of Spectra.

The apparatus by which the spectra may be photographed consists of an ordinary camera obscura attached to the end of a long wooden tube, which opens into a cylindrical box, within which is a prism glass, or a hollow prism filled with bisulphid of carbon. If the prism be so adjusted as to throw the solar rays, reflected from a heliostat, upon the screen of the camera, and the wires transmit the sparks from a Ruhmkorff coil are placed in front of the uncovered portion of the slit, the two spectra are simultaneously impressed. The solar beam is easily intercepted at the proper time by a small screen, and the electric spectrum is allowed to continue its action for two, or three, or six minutes, as may be necessary. He did not find that anything was gained in distinctness by interposing a lens of short focus between the slit and the wire which supplied the sparks, with the view of rendering the rays of the electric light parallel like those of the sun, owing to the absorbent action of the glass weakening the photographic effect; and the flickering motion of the sparks magnified by the lens, rendered the lines less distinct than when the lens was not used. Although with each of the metals (including platinum, gold, silver, copper, zinc, aluminum, magnesium, iron), when the spark was taken in air, he obtained decided photographs, it appeared that in each case the impressed spectrum was very nearly the same, proving that the few lines produced were those which were characteristic to the metal. The peculiar lines of the metal seemed chiefly to be confined to the visible portion of the spectrum, and these had little or no photographic power. This was singularly exemplified by repeating the experiment upon the same metal in the air, and in a continuous current of pure hydrogen. Iron, for example, gave, in hydrogen, a spectrum in which a bright orange and a strong green band were visible, light produced by the action of the coil was allowed to fall ten or fifteen minutes upon a sensitive collodion surface, scarcely a trace of any action was procured; whilst, in five minutes, in the air, a powerful impression of numerous bands was obtained. It is remarked by Mr. Talbot that, in the spectra of colored flames, the nature of the acid did not influence the position of the bright lines of the spectrum, which he found was dependent upon the metal employed, and this remark had been confirmed by all subsequent observers. But the case was very different in the absorptive bands produced by the vapors of colored bodies,—there the nature of both constituents of the compound was essentially connected with the production of absorptive bands. Chlorine, combined with hydrogen, gave no bands by absorption in any moderate thickness. Chlorous acid and peroxyd of chlorine both produced the same set of bands, while hypochlorous acid, although a strongly colored vapor and containing the same elements, oxygen and chlorine, produced no absorptive bands. Again, the brownish red vapor of perchlorid of iron produced no absorptive bands; but when converted into vapor in a flame this gave out bands independent of the form in which it occurred combined. These anomalies appeared to admit of an easy explanation on the supposition that, in any case, the compound is decomposed in flame, either simply by the high temperature, just as water is, as shown by Grove, or, in all other cases of the production of bright lines by the introduction of a metallic salt into a flame of burning bodies (as shown by Deville). In the voltaic pile the decomposition must of necessity take place by electric action. The compound gases, protoxyd and binoxyd of nitrogen, gave, when electrofied the same series of bright bands (as Plucker had shown) which their constituents when combined furnish. Aqueous vapor always gives the bright lines due to hydrogen and hydrochloric acid, the mixed system of lines, which could not be produced by hydrogen and chlorine. The reducing influence of the hydrogen and other combustible constituents of the burning body would decompose the salt, liberating the metal, which would immediately become oxydized or carried off in the ascending current. There was obviously a marked difference between the effect of intense ignition upon most of the metallic and non-metallic bodies. The observations of Plucker upon the spectra of iodine, bromine and chlorine show that they give, when ignited, a very different series of bands to those which they furnished by absorption, as Dr. Gladstone had already pointed out; but it was interesting to remark that, in the case of hydrogen, which, chemically, was so similar to a metal, we have comparatively simple spectrum. It was, however, to be specially noted that the hydrogen occasioned no perceptible absorptive bands at ordinary temperatures in such thicknesses as we could command in our experiments, and the vapor of boiling mercury was also destitute of any absorptive action, although when ignited by the electric spark it gave a characteristic and brilliant series of dark bands. The following experiment suggested itself as a direct test of Kirchhoff's theory. Two gas-burners, into which were introduced chlorid of sodium on the wick of the spirit lamp, were placed so as to illuminate equally the opposite sides of a sheet of paper partially greased. The rays of the electric light screened from the photometric surface, suitably protected, were made to traverse one of the flames. If the yellow rays of light were absorbed by the sodium flame, the light emitted laterally by the flame should be sensibly increased. The experiment, however, failed to indicate any such increase in the brilliancy of the flame, possibly because the eye was not sufficiently sensitive to detect the slight difference which was to be expected.—*Athenaeum*, Sept. 14th, 1861.

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc. The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing. c16

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the book of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINER'S COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silverman, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. Metals—their chemistry and geology; 4th. Improvements in assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.]

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silverman, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rocks is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 39 pages treat of assaying. These first three chapters contain most valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips' Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.]

A BOOK FOR THE MINER.—We have received from the publisher J. Silverman, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide," a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work. It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.]

NEW AND VALUABLE MINING BOOK.—We have been presented with a mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the book is "The Miner's Companion and Guide, and Treatise of California Mines exclusively." It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[San News.]

A VALUABLE WORK FOR THE MINER.—Our thanks are due to Mr. Silverman of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, which are not familiar to our miners, and which adds much to its value. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout our mining towns for its merits and lucubrations. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth her tagged soil its hidden treasures.—[Union Temperance Journal.]

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207 766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,521 55 being some \$230,000 less than the limit, and, in fact, a loss under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is two to two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,339. Under Mr. Hempstead, the total expenditures for three years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. Retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of state at large. The charges are as follows:

For parting silver from gold when gold

is below 300-1000ths. fine. 3cts per

" from 300-1000ths. to 750-1000ths fine. 7cts

" 750-1000ths to 950-1000ths " .14cts

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce ½ per ct. on gross value of all gold continued for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight 301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, ½ per ct. gross value of silver for making bars; also when gold is contained per ct. on gross value of gold for coining. Refining charges in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. ½ per ct. gross value to be paid for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. ½ per ct. gross value for coining, when gold is contained, refining charge the same in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. ½ per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule is hereafter to be, that the value of gold contained in the bars will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of ½ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver registers as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges, were promulgated on July 10th, by Superintendent Robt J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rate, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent

THE FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California. By recent additions to the extensive establishment, we can confidently announce to the public that we now have

Best Foundry and Machine Shop on the Pacific Coast.

An upwards of forty five thousand dollars worth of patterns, we are enabled to work cheaper and quicker than any other establishment on the Pacific Coast.

make to order, and have for sale, High and Low Pressure Engines, Marine and Stationary; Straight Quartz Mills of all sizes and kinds; Stamp-shoes and dies of iron, which is imported by us expressly for purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Mule, and Circular Saw Mills; Siding Machines, cutting 25,000 per day and more perfectly than any now in use. One of these shingle machines seen in operation at Metcalf's mill in this city.

and Amalgamators, with the latest improvements; Howland & Hauss Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now

and Screens, of every degree of fineness made of the best Russia Iron, and Axes of all dimensions; of Hauling Fronts; Horse Powers; Mills, Bolter Fronts; Wind Mills; of Hunt's, Johnson's and Lum's Patent; to make a long story short, we make castings and machinery of description whatever; also, all kinds of Brass Castings.

work promptly attended to. We are thankful to the public for their many past favors, we would respectfully continue of their patronage. Before purchasing, give us a call what we can do.

GO IDAID & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, } San Francisco
Union Reduction Company, }
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the field; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- 12th. We invite Farmers wishing a machine to call and see before purchasing.

Wilkinson's Process.

The following *grande rouse* on a grand scale has recently been published by the *Colonial Mining Journal*. It will prove highly interesting:

Rumors had reached us that the Commissioner of Mines intended to appoint a Board to examine into the merits of this gentleman's method for extracting gold from quartz, but we deemed the rumor so improbable that until the report had been presented to us by a friend we had given no credit to it. The Commissioner of mines, as representing a mining constituency (Ballarat), naturally presumed, must have been aware that many of those interested in mining progress at that gold field had given Mr. Wilkinson's method a fair trial, at an outlay of several hundred pounds, and that commercially it had proved a failure. We will briefly lay before our readers the history of this scheme of Mr. Wilkinson's.

Some few years ago a meeting of gentlemen interested in quartz mining, allured by the pretensions of something wonderful to be accomplished, took place at Fraser's Hotel, William street (now Jones'), and the largest room was crowded by those wishful to encourage the object. After Mr. Wilkinson had been closely cross-questioned on the nature and mode of conducting his plan, though the meeting was not satisfied, still from the confidence expressed by Mr. W. respecting it, and his positive conclusions as to its value, the meeting appointed Mr. Fraser treasurer, and nearly all present put down their names for various sums, amounting to £150, the sum stated by Mr. W. as needful to give the subject a fair trial. Mr. Fraser at the same time offering the yard in the rear of his premises to erect the furnace, &c., and it was left with Mr. F. to carry out the objects of the subscribers. However, Mr. F. not being able to arrange matters with Mr. W., the affair fell through.

The plan or idea of Mr. Wilkinson's at that meeting, was as follows:

He stated that at various temperatures divers metals were melted, by his plan of uniting two gases, oxygen and hydrogen, a powerful heat would be obtained, and that any metal in the quartz which was soonest affected would be melted, and in succession fall from the quartz into a pan supplied with water. Lead, copper, iron, gold, or any other metal, and the mass of the quartz thus operated upon would give up its contents, and this hypothesis he subsequently attempted to carry into execution at Ballarat, the result we have already stated. Some months after this failure Mr. W. proceeded to Anderson's creek, and there erected a plan to carry out his scheme, at a cost of many hundreds if not thousands of pounds sterling. As the results of previous trials had not established his first pretensions, he erected a light battery of stamps to crush his highly calcined quartz, amalgamating the residue subsequently. In July 1860, fourteen months ago he lectured at the Mechanics' Institute, Melbourne, and in our July number for that year, printed the same *verbatim*, and illustrated his furnace from a copy of a diagram exhibited at that meeting. Our readers will perceive that in his first mention of his plan, and at the trial at Ballarat, crushing the quartz was never intended; the gold was supposed to be extracted by the high heat, as explained. This after mode of crushing only followed to carry out his notions of crushing somehow.

Of the Board of Science we need not here say anything, we supposed it has merged into the Mining Department, presided over by the Honorable the Commissioner of mines. But the essence of folly is most strikingly developed in the Committee appointed at the expense of the country to report on the value of Mr. Wilkinson's method, on which thousands, we are not beyond the limits of stating, already, have been spent in experiments. It so happens that the extraordinary large sum of five hundred pounds has been granted by the government, to be disbursed in trying any experiments the Commissioner may recommend. Mr. Wilkinson evidently has an eye to this, and having wasted his own resources, he has actually allowed the Commissioner to be bamboozled into granting a committee to visit Anderson's creek; and, accordingly in March last five gentlemen visited the spot, and last month a tedious report was made by them and they state that £380 would serve to try the scheme on a larger scale. In paragraph 14, the Board state that by Mr. Wilkinson's plan the cost of calcining, as proved at Anderson's creek, is 5s 7d, whereas at Clunes it is 3s. 11d. Thus, after all this display, and on which this Board has sent in its report, this is the result—that Mr. W.'s process of roasting may be an improvement on the ordinary means adopted.

We had hoped that the vagaries of the Board of Science had been buried, but we find that they have been resuscitated under the Commissioner of Mines, who not only has permitted the public money to be wasted in a worthless report, inasmuch as the public already, from Mr. Wilkinson himself had known all it has communicated. We think it to be a libel on the mining community to expend any money after what has already been proved of this scheme of Mr. Wilkinson's, but this is not, we fear, the end of it. This report we believe is only preparatory to £380 of the £500 being expended to try as the report says, on a more extended scale, what Mr. Wilkinson, with three or four times that amount, has not been able to accomplish. And if the Commissioner of mines has any respect for his Ballarat experimenters,

and is not disposed to proclaim his utter want of capacity in judging of mining matters, he will not suffer any more such committees or Boards to be palmed upon him by the friends of Mr. Wilkinson's, to do that which his own observations ought to have ere this demonstrated to him to be useless, and only a shameful attempt to obtain money for the purposes of being thrown away on scheme already proved valueless and ineffective commercially.

What the "Louisville Journal" Says:

"We do not believe that even in this cheap age of publications any work can be more reasonable than the terms of the *Scientific American* at \$2 per annum, with twenty-five per cent discount for clubs of ten. It forms a yearly volume of 832 pages quarto, with an immense number of original engravings of patented machines, valuable inventions, and objects of scientific interest. There is not an industrial pursuit that does not receive a share of its attention. It contains official lists of patent claims, important statistics, practical recipes for useful domestic purposes, and has long stood, both in this country and Europe, as the highest authority in the mechanic arts and sciences. There is no publication more valuable to the farmer, the miller, the engineer, the iron-founder, the mechanic, or the manufacturer. We have never opened a number without learning something we never knew before, and obtaining valuable information for the benefit of our readers. The Publishers, Messrs. MUNN & Co., of 37 Park Row, New York, have deserved the success they have achieved. No one should visit the city without calling at their palatial establishment, which is a museum of inventive genius, collected from the entire world. If any of our friends away off in the country do not know this work, and will take our advice, they will mail \$2 and become subscribers immediately, or by applying to the Publishers they can obtain a specimen copy gratis, which will be sure to confirm the truth of our recommendation.

Messrs. Devoe & Co. are heavily driven in completing the numerous orders for engines now on their file. They are renowned for this kind of work.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

To mail subscribers:—Four Dollars per annum.
Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

UNION IRON WORKS (ESTABLISHED IN 1841)

N. E. Cor. First and Mission streets, San Francisco.

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the twelve years, during which time new and extensive Buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS MACHINERY AND CASTINGS,

Of every description, on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Powers, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work, Steamboat Repairing and Blacksmithing, etc.

STEAM ENGINES BUILT AND REPAIRED.

Besides the extensive assortment of Machinery Patterns, attention is called to the new and beautiful designs for Building Castings, Iron Fronts, Columns for Stores, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, Etc.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & C. M. WOODWARD'S PATENT.—This Pump is used for supply Steam Boilers, Mills and Public Buildings, with water. In case of Fire arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the Discharge Outlet. It is suitable both for Maritime and Mining purposes, being used on nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED from shafts, driving Quartz Machinery, etc. PETER DONAHUE, Proprietor

OILS AND LAMPS BY LATE ARRIVALS.

STANFORD BROTHERS HAVE RECEIVED

A GREAT VARIETY OF COAL OIL LAMPS of every style of BURNING known to the trade.

BRACKET LAMPS AND SIDE LAMPS with the largest burners in use. PARLOR AND STAND LAMPS—An endless variety of Patterns. CHAMBER LAMPS AND HANDLE LAMPS—Very cheap; may be carried about.

CHANDLERS AND LANTERNS.
CAMPHENE LAMPS OF ALL KINDS.
COAL OIL AND CAMPHENE WICKS.
CHIMNEYS, SHADES, GLOBES—Of every size, style and finish.

200 BARRELS SPERM OIL—At a lower price than ever before sold in this city.
100 BARRELS LARD OIL—Of our own importation.
600 TUBS RAPE SEED OIL—in original packages.
100 BARRELS HOILED LINED OIL—guaranteed pure and free from fish.
400 CASES DOWNY'S KEROSENE.
800 CASES COAL OILS—At the very lowest market prices.
1,000 CASES CHINA OIL—in 2½ gal. tins.

We feel confident in assuring our CUSTOMERS and the TRADE generally that they will find our assortment of LAMPS AND LAMP STOCK, as well as OILS and all kinds of BURNING MATERIALS, the most complete has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms, and we are determined to fix our prices at a standard so low that dealers in line of goods can buy in their Winter Stocks, and have a wider margin of profit than they have ever had before.

STANFORD BROTHERS,

121, 123 and 125 California street,—Near Front.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, JANUARY 18, 1862.

NO 18.

Few inventors of the present day have attained a greater name or celebrity for one of the greatest household utensils, than Messrs. Wheeler & Wilson. Whenever and wherever an improvement can be effected it is executed, as we shall herein show. The above excellent illustration represents a minute and detailed view of its construction, with its many interesting, practicable and scientific improvements, among which we may mention the glass orifice through which the needle passes, and the bush keeping the thread shuttle-loop in its position. The engraving represents the machine with the cloth plate removed, which is otherwise marked with a white dotted line and in the position as it should appear.

Of its superiority over other machines it is justly entitled to the merit it now enjoys. In point of elegance, style and finish, it is unrivalled.

In a recent number of one of our German contemporaries we read of the adoption of this machine in several leading manufacturing houses, in preference over all other machines. It is particularly recommended for the beauty and excellence of stitch,—the strength and elasticity thereof. The great economy of thread, its attachments and range of application to purposes and materials, compactness, simplicity, thoroughness of construction, and what is more than all, the great speed, ease of operation and management, and lastly, its quietness of movement. Mr. H. C. Hayden is the agent for California, whose office is on the corner of Montgomery and Sacramento streets, in this city.

This stitch is formed with two threads, one upon each surface of the fabric sewed, and interlocked with each other in the center of it. It forms an elastic seam that cannot be raveled, and presents the same appearance upon each surface, a single line of thread extending from stitch to stitch. From two and a half to three yards of thread are required for one yard of seam, the quantity of

Lock-Stitch.

course varying slightly with the thickness of the fabric sewed. It is a stitch of this character that commands itself especially to one's judgment as being the stitch appropriate to sewing woven fabrics, and if the seam be made of thread of suitable strength, it will prove as strong and elastic as the fabric sewed. It is a stitch that has been used for fourteen years in sewing every species of material, from the heaviest harness and upholstery to the lightest gossamer, with unqualified satisfaction. Its excellence is no longer problematical, and passes as unquestioned as that of any other stitch. It is sufficient to say that, when properly formed, it is as firm and elastic as the fabric sewed, whether subject to lateral or longitudinal pressure, while it is hurried so far below the surface of the fabric sewed that it is not affected by the action of the smoothing-iron in the laundry, or other wearing surfaces.

These machines work well on silk, linen, woolen and cotton goods,—sewing, quilting, gathering, hemming and felling,—performing every species of sewing, except making button holes, stitching on buttons, and the like. The operator seats herself before a small table, on which the machine is placed, with her foot upon the pedal treadle, by which the machine is driven. The fabric to be sewed is placed upon the cloth plate, beneath the needle, to pass from left to right. Gauges are furnished for regulating the width of the seam, until the hand and eye have become trained to dispense with them. The thread above the fabric is used from the original spool. The lower thread is used from a patent bobbin, upon which it is rewound. The lower thread is required for filling the spool. All Nos. of thread are used, and needles of different sizes are furnished, suited to the various threads.

The threads and fabric to be sewed being adjusted, the machine is touched into motion by a gentle pressure of the foot upon the pedal. The motion is communicated directly by a band to the mandril, which rotates the circular hook, and thence to the needle-arm. The bearings and friction surfaces are so slight, that the propelling power required is merely nominal,

WHEELER & WILSON'S RECENT IMPROVEMENTS.

and the wear of the parts is so trifling, that machines used continually in shirt and collar manufactories, for five years, are as good as new. The rotary hook, feed, hobbin and other parts, at all subject to wear, are made of finely tempered steel. The other parts are tastefully ornamented, or heavily silver-plated. Should any part, by accident, be broken, it can readily be replaced, at slight expense, as thousands of pieces are made precisely similar, and fit each of all the machines.

The Falling off in the Patent Office.

The statistics of the Patent Office exhibit a great falling off in receipts, and a corresponding increase of expenditures since the beginning of the war. The number of patents applied for has diminished to a remarkable degree—ninetieths of our inventors having apparently joined the army as volunteers.

The receipts of the office from January 1 to Sept. 30, 1861 were \$102,808 18; and the expenditures were \$185,594 05, showing an excess of expenditures over receipts \$82,785 87. During the corresponding period of the last year the receipts were \$197,348 40, being \$98,840 22 more than the receipts for the same part of this year. During the same period 3,514 applications for patents and 519 caveats having been filed, 2,581 patents have been issued, and fifteen patents have been extended. No branch of the public service illustrates so strikingly the evil effects of the rebellion.

The last remarks are from the *Mirror*, who have however lost sight of one redeemable feature in the above "affairs." The Pacific States through the PACIFIC PATENT AGENCY have of late resuscitated this loss. Our inventors are not warlike but adhere strictly to their inventive genius. We are constantly preparing papers for the Patent Office, and the revenue from the Pacific States must be at least one-fifth of the above income. We have facilities which perhaps no other solicitors possess.

COAL INDICATIONS.—Several years ago, says the Napa Reporter, it was believed there was no coal in California. The igneous appearance of the mountains, and their evident volcanic origin, led geologists to suppose that after the fossiliferous era, it must have been all burned out. Since the commencement of the explorations for silver, quicksilver and copper in the Coast Range, many veins have been discovered, one of which at Mt. Diablo, is being profitably worked. In Sonoma and Napa counties outcroppings of veins have been discovered, and perhaps there is not one hundred square miles on the Coast range that does not contain coal. It has been found in quantities in Nevada Territory, and at Grass Valley, and other places in the Sierra Nevada. In time, we have faith to believe, opal will have been discovered in sufficient quantities to supply the home demand of California.

—10—

NORTON GOLD AND SILVER MINING COMPANY.—Articles of incorporation were to-day filed in the county court organizing a company under the above designation for mining operations in Nevada (Carson Valley Territory). The capital is eighty thousand dollars in shares of fifty dollars each. The trustees are F. A. Benjamin, George M. Norton, A. W. Snyder and Charles Hosmer.

—10—

SILVER IN MEXICO.—It is estimated that since the commencement of silver mining in Mexico, that country has produced three thousand millions of dollars worth of silver.

THE SAN JOAQUIN PRESS SAYS: C. A. Peck, Eli B. Tryon and Abel Low, who visited the Potosi mines in New Mexico, and located claims there last spring are at present in town on a visit. They will return to the mines next spring, where they think in the parlance of the day, they have a good thing of it. The company to which they belong are working with an arastra, and are taking out considerable quantities of silver. Mr. Tryon was slightly wounded while working in the El Dorado company, by the premature explosion of a blast. The parties bring with them several fine specimens which they exhibit to their friends. They express great confidence in the future of the mining region alluded to.

MEXICAN EXPRESS.—An express between this city and Mexico is proposed by Mr. Cornelius Stagg, to be carried via Acapulco, the time to be nine days between the two points. Just now, when there is likely to be a fine row between Mexico and Spain, in which, we predict the latter will be eventually whipped, and constant and reliable means of communication between our State and the capital of the sister republic is an interesting subject to the news-reading community as well as to the mercantile world of California.

ANOTHER MINING COMPANY.—The San Francisco Silver Mining Company filed its incorporation yesterday, in the County Court. Its object is to mine in Sinaloa and other Mexican States. Capital stock \$50,000—in one hundred shares. The first Board of Directors is James Shields, T. N. Carman, J. D. O. Callaghan, Chas. Corkery, Francis Ready, Michael Cody and Michael Hawkins.

Report of H. R. Reed, Who visited Aurora, Esmeralda, to look after the Property of the Falls of Clyde Joint Stock Company.

I left San Francisco on Monday afternoon, October 27, on the steamer Nevada, with sixty-five dollars in cash, which was collected by Secretary Duncan from a few of the share holders. I arrived at Sacramento on the morning of the 28th, and took conveyance by steam and stage to Placerville; upon arriving at that place I found to my disappointment no direct conveyance by stage to Esmeralda, but was informed there was a stage once a week from Carson City to Esmeralda, leaving on Mondays. As the passage from Placerville to Carson city was twenty-five dollars, I first telegraphed to Carson to know if I could obtain a seat in the stage for Esmeralda. Message came back that the seats were all taken for the next trip. Being anxious to get to Aurora as quick as possible I purchased a mule, saddle and bridle, and left Placerville on the morning of the 30th October.

After 5 days travel through a hazardous disagreeable country, I reached Aurora, the place of my destination after sunrise, having traveled the entire night, without rest or food for myself or mule. Upon my arrival at Aurora on the 4th day of November, 1861, I ascertained all the claims embraced in our company was "jumped," viz. the Rob Roy, the Ben Lomand and the Falls of Clyde.

After a few hours rest, I immediately found out the location of the property, which is on the Silver Hill—distance about two miles from the town. Upon my reaching the claims I found notice upon each of re-location, and the names of the lodes changed. I read the notices and took them down; at one of which I had some resistance: but I accomplished what I went there to do, which was only the preliminary steps. After I returned to town, and by legal advice served the following protest on the Recorder of the District:

To EDWARD GALLAGHER Esq.,

Recorder of Mineral Lands, in Esmeralda Mining District.

SIR.—Please to take notice that we, the undersigned, trustees of the Falls of Clyde consolidated company—comprising the Falls of Clyde, the Ben Lomand and Rob Roy lodes of quartz, the same being located in this district, and regularly organized in accordance with an act of the State of California, regulating incorporated companies, against the recording in your office, or by your direction, of any re-location of the before mentioned lodes, such re-locations being an infringement upon the rights and privileges of said incorporated company.

H. R. REED.

L. LARZUT, Trustees.

Aurora, Esmeralda, Nov. 9th, 1861.

The Recorder acknowledged service of the protest, and placed the same on his book of records.

The day following I invited the Recorder to visit Silver Hill with me, and I would readily convince him that there had been sufficient labor and other valuable expenditures upon the company's property, to protect it from re-location. After going to the claims we examined the different lodes in question, and I endeavored to impress upon his mind that upon the Falls of Clyde there had been work sufficient done to answer the requirements of the mining laws, then extant in the district, and the said claim or claims should be held sacred to the company; and said I, take it for granted, had there not been sufficient work done on the Rob Roy and Ben Lomand, nevertheless it was a joint stock company regularly incorporated and was entitled to more extended privileges than individuals, and in my estimation there having been sufficient work done on one claim, would suffice for the whole, as they were consolidated all three in one. After this we left the hill.

The recorder said he would take the case into consideration. In the meantime I found one Robert Isaacs and one James Doyle, being two of the original locators, who had employed one Archibald, who was among the "jumpers" to work on the claim on the morning of the first of Nov. for the protection of their interests, of two hundred feet each, as originally held by them. After conversing with Mr. Isaacs and Mr. Doyle, they stated they were under the impression the company had abandoned the property, and having faith in the Falls of Clyde, they intended to protect their own personal interests from the "jumpers." I finally got Archibald to waive his "jumper's" interest or claim, by

paying him for his work myself, done on said claim, on the first of November, and promising when we opened the lead further to employ him, if he would work as reasonable as other men, for the company. I also fixed the thing all right with Isaacs and Doyle, that the said Archibald was not at work for him and Doyle alone but for the company. The following is Archibald's receipt:

\$5.—Received from Henry R. Reed, Treasurer of the Falls of Clyde Consolidated company for quartz mining, five dollars, for working on said company's lodes, on the 1st day of November, 1861, being set to work by Doyle and Isaacs, original locators.

Signed

JAMES ARCHIBALD.

Aurora, Esmeralda Dis., Nov. 12, 1861.

Witness, E. J. SAGENDORF.

After obtaining this receipt, I called upon Recorder Gallagher, and presented it to him for perusal. After reading it he remarked, "You have struck the nail on the head, and I can't go behind or under it." He then gave me the following certificate:

This is to certify that I, Edward Gallagher, District Recorder of Esmeralda District, Mono County, State of California, do hereby declare that I have refused and will not place upon record, any re-location on the Falls of Clyde Consolidated Company, being satisfied that one James Archibald in the employ of parties interested in the company, was in actual working possession of said company's claims or lodes on the first day of November, A. D. 1861.

Signed,

E. GALLAGHER,

Recorder, Esmeralda Dis.

Witness, H. R. REED,

Aurora, Esmeralda Dis., Nov. 12, 1861.

This was all I could do, so I saw Mr. T. Burt, who is a shareholder, and requested him to look after the claims, until such times as the company made arrangements to go on with the work permanently. The claims I will state are not jumpable again until June next.

I left Aurora on the 16th day of Nov., and after a tedious and very unpleasant journey of eight days, through snow, hail and rain, I reached Placerville, being much used up by the long exposure, and was compelled to lay up two days in Placerville.

On the morning of the 28th of November I reached San Francisco, after a prolonged absence of one month and a day.

I would advise as soon as practicable some action be taken for working the Falls of Clyde. I think with all others who has seen the lode, with its croppings towering up like a church steeple, to be one of the most valuable lodes on Silver Hill. It is situated and lying between the Esmeralda discovery and the Winemuck, two celebrated lodes of the district.

I will not prolong my statement by saying more of that wonderful country and its minerals but will now touch on finances. When it was deemed imperative that some one should proceed to Aurora, to look after and protect the property of the company from "jumpers," I offered to go, not thinking it would consume my time and business more than ten days, I stated to the secretary, Dunear, if he would collect from the shareholders eighty or one hundred dollars, I would go up and give my time, or if any other party would go I would give twenty-five dollars towards the expense myself; but no one wanted to go so I started on the journey, receiving from Secretary Dunear sixty-five dollars in cash, which amount he collected from a few of the shareholders. The sum was not adequate to the expenses. The following is my account of receipts and expenditures:

The Falls of Clyde Consolidated company, to Henry R. Reed, Dr.

Placerville, Oct. 30, 1861. To cash paid for mule...\$80
Aurora, Nov. 7. Cash to attorney, protest &c..... 10
" " 12. To labor done on claim, for my expenses and mule keeping from San Francisco to Aurora and back.....115

Total

\$210.

By cash from Sec'y. Dunear.....\$65

By sale of mule..... 50

Total.....\$115

Balance due me.....\$95.

This together with the report I respectfully submit.

HENRY R. REED.

SAN FRANCISCO Dec. 20, 1861.

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of most European countries that the system of examination is as to so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH,

SAN FRANCISCO.

N. B.—R. W. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will hereafter transact all business pertaining to patents for us, at the patent office in Washington city. For instructions and the new law regulating patents, we refer the inventor to the above.

Miners, Inventors, Agriculturalists, Capitalist and Mechanics, will find it to their advantage to subscribe for the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued ever Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

Arizona.

We have seldom read a paper more interesting than the subjoined, which has been read before the Academy of Natural Sciences Aug. 5th, 1861, with reference to the mineralogy of the silver mines in Arizona, by Mr. R. Pompey who has since left for his new field of labor on a geological tour through the Empiro of Japan.

Arizona proper, or Gadsden purchase, is that part of our frontier which has the Rio Grande and the Colorado rivers for its eastern and western, and the Gila and Mexican boundary line for its northern and southern limits.

It thus extends over both slopes of the *Sierra Madre*, which here loses its continuous character, giving rise to almost unconnected mountain groups. It is also traversed from N. W. to N. E. by granite *sierras* seldom over seventy to ninety miles in length, and distant from each other from twenty to forty miles. This configuration gives rise to a most remarkable occurrence of parallelism.

The intervals between these ranges are plains, having a gradual descent from the *sierras* on either side. In the western part of the territory, where but little rain falls, water courses are very rare and the surface of these tracts is almost unbroken; but in the central portion, near the larger mountains, they present the appearance of extensive valleys and are cut up by river beds and frequent tributary *canyons*.

These plains are all connected and form members of the immense quaternary deposits, extending from the Gulf of California eastward.

The quaternary formation is stratified, and composed of both rounded and angular rocks with pebbles and sand—the detritus of the neighboring mountains and the underlying formations. A gradual and regular descent of the surface of the whole quaternary area towards the Gulf of California and the Colorado river is perceptible, showing that there has been a gradual elevation extending over a large area, and probably during a long lapse of time. That this upheaval is of a recent date, is proven by the presence of existing species of marine shells scattered over the surface.

As I have already said, the majority of the mountain ranges are granitic, but we find in many places, and especially those where the parallelism is disturbed, extensive representations of other formations.

Usually, outcroppings of gneiss, micaceous, talcose and clay slates are observable at the base of the granitic ranges. In many places the plains consist entirely of the detritus of these rocks, showing that they extend from mountain to mountain. Towards the Gulf of California, these slates are accompanied by metamorphic limestone, and often appear forming independent ridges, or inclined against the higher granite hills. They form the gold region of Sonora, and are probably of the same age as the similar formations of California, of which, indeed, they seem to be the continuation. We find them rising out of the desert, at intervals, from Sonora to the Gila river and the Colorado, and again underlying the tertiary on the western skirt of the Colorado desert, and at various points in Southern California.

Near the coast, and traversed by the boundary line is a very interesting volcanic formation. The country is studded over with volcanic cones, some containing craters; immense streams of lava cross the desert, or cover, as with a mantle high granite hills.

The next formation of importance is that of the stratified conglomerates. These occur in strata of very variable thickness and texture but all are composed for the most part of fragments of quartziferous porphyry, cemented by feldspathic mass, also quartziferous. This formation is traversed by intrusive dykes of a porphyry of a similar nature to many of the fragments enclosed in the conglomerates.

There is also a great variety of porphyries, both quartziferous and free from quartz; and these are the rocks which for the most part stand in the closest connection with the veins of the country.

Many of these porphyries appear to be the result of metamorphic action on sedimentary rocks; but others have every characteristic of an eruptive origin.

Lastly, dykes of a trachytic porphyry, and of a cellular, black rock usually in connection with a reddish *wacke* and a sandstone, are observable at various points throughout the country.

Climate influences have given the country a marked and peculiar character of vegetation. Towards the coast the plains are barren and arid deserts, and the traveler may ride hundreds of miles without seeing other plants than dry and thorny *creosote* and scattered bushes of greasewood. The granite mountains bordering these deserts are even more barren. Not a tree, nor even a *cactus*, can be seen on their sides. They tower high above the plains, great masses of white, reflecting the rays of the sun with dazzling brilliancy.

The only water to be found over an area of many thousand miles is at a few points in the mountains, where the rains have collected in natural tanks sufficient to last a few months. During the rainy season, which often nearly fails, shallow pools are formed in slight depression on the surface, but a few days sun is sufficient to exhaust these sources.

Further from the coast the plains begin to show more vegetation; gradually appear the *palo verde* and *mesquite* and a greater variety of cacti, and on the hills scattered *saguaro* (*Cylindropuntia gigantea*); until, in the eastern portion of the *Papagoria*, the country is more thickly covered with a low

growth of *mesquite* and *palo verde* brush, above which looms a perfect forest of the columnar *saguaro*.

East of the Baboquiveri range, the character of the country changes; the plains are cut in the direction of the longer axis by deep valleys, receiving tributary cañons from the mountains on either side, and all that remains to show their original character are the cut-up *mesas*, or table lands, lying between the river and the *sierras*.

These *mesas* retain indeed much of the desert appearance; but they are clothed with bunch and grama grass, and scattered *mesquite* bushes. Many of the valleys have an extensive growth of *mesquite*, and along the river beds in the neighborhood of some running or hidden water grow large cottonwood trees, and in some places line ash timber. On the hill sides, above the level of the *mesas*, are scattered the live oak of the country, the trees varying from twelve to twenty-five feet in height, giving the country the appearance of an old orchard. As we ascend the mountains, the oaks are mingled with the cedar; until, at an elevation of about 6,000 feet above the level of the sea, the pine region commences.

Owing to the peculiar structure of the river beds, which run through loose quaternary deposits, the water falling during the rainy season soon sinks out of sight and follows its course underground, appearing only where the underlying older formations rise, or where the valley is crossed by a dyke, in either case natural dams being formed. These occurrences are sometimes of sufficient extent to form running streams for several miles, although usually either only a spring is formed, or more frequently water is obtained by digging.

These valleys of Central Arizona, as well as the *mesas* and hill sides, are covered with an abundant growth of different grasses, forming extensive tracts of grazing country. There are many localities suitable for cultivation, these being confined to such places as have running water for a considerable distance, which can be conducted in canals for irrigation.

Arizona forms a link in the great chain of mining regions that stretches along the western side of the continent. Though but a small portion of the country has been explored; yet, between the Rio Grande and Colorado, numerous districts of great mineral wealth have been discovered, and on some of them more or less labor expended. The Mexicans have, at various times since the middle of the last century, commenced workings on a great number of veins, but owing to the inroads of the Apaches, but little was accomplished by them.

After the conclusion of the Gadsden treaty, Messrs. Poston and Ehrenberg, with a small party, entered the country, and after prospecting a large number of localities found the Heintzelman vein.

The results of an examination of this proved so satisfactory that considerable attention was drawn towards that part of New Mexico. Joint stock companies, with little ready capital and immense expectations, were formed. Speculators bought in stock for ten per cent. of its nominal value, and sold out at fifty per cent. to ninety per cent. to tradesmen and widows, too poor to meet assessments, when means for working were absolutely necessary. Men were put in charge who had never seen a mine, and usually with no professional assistance. The results of enterprises conducted in a similar manner are well known. Between the absence of available funds on one hand, and of protection of life and property, on the other, enterprise was already beginning to stagnate, when the withdrawal of troops made the abandonment of the country absolutely necessary.

The most important of the mines already known and worked is the Heintzelman, or *Cerro Colorado*, belonging to the Sonora Mining Company. It is situated west of Tubac, about twenty-four miles by road. The vein runs north and south, has a nearly vertical dip, and is enclosed in a brown porphyry, free from quartz, and is containing ill-defined crystals of feldspar. The thickness of the lode is from twelve to twenty inches. A vertical main shaft has been commenced, with the expectation of intersecting the vein at a depth of two hundred feet, but it is only completed to about one hundred and twenty feet. This shaft communicates by cross-cuts, at sixty and one hundred feet, with two galleries.

The ore is separated by hand into two classes, rendered necessary by the difference in their chemical character and in their richness in silver. The first class consists of the more massive and richer ore, composed of Stromeyerite, tetrahedrite, blende and galena, with native silver; the gangue is quartz, with some barytes and carbonates of magnesia and lime. The blende and galena are so predominant in this class as to render the ore unfit for amalgamation, while the percentage of silver in the Stromeyerite is too great to allow of its being treated profitably in the barrels. This class represents about ten per cent. of the entire amount of ore, and the average of its yield of silver, calculated on the entire amount smelted, is nearly \$1,000 to the ton of 2,000 pounds, while the amount contained is about fifteen per cent. more.

Continued in our next.

Mining Companies and Associations.

POSTPONEMENT OF SALE.—Delinquent stockholders of the Eagle San company, Flawerty Mining district, are hereby notified that the sale of delinquent stock advertised to be sold on November 10th, has been postponed until Monday, the 18th inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at P. M.

By order of the Trustees.

JOHN G. GILCHRIST, Sec'y.

69. St. Louis Gold and Silver Mining Company.—Notice is hereby given that the Board of Trustees of the St. Louis Gold and Silver Mining Company have, this 15th day of October, 1861, levied an assessment (for completing their mill) of two dollars upon each share of the capital stock of said company, payable to the Secretary, at No. 40, Montgomery Block, San Francisco.

By order of the Board of Trustees.
J. H. BREWER, Secretary.

70. Office of the Cole Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cole Silver Mining Company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent. on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be sold and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.
J. B. COFFIN, Sec'y.

71. Office of the Dos Padres Gold and Silver Mining Company, 215 Front street San Francisco, October 25th, 1861.—A meeting of the stockholders of the Dos Padres Gold and Silver Mining Company, held at the office of the company, on Saturday, November 15th, at ten o'clock A. M. An amendment to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

72. Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees.
JOEL F. LIGHTNER, Secretary.

73. Office Gould & Curry Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WADSWORTH, Secretary.

74. Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one-half of which he made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HUGGINS, Secretary.

75. Office Crown Point Gold and Silver Mining Company, 321 Front st., San Francisco, Oct. 28th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

76. Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining Company has this day been levied, payable on or before the 10th of December next, at the office, as above.

J. H. JONES, Sec'y.

77. Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining Company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 28th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City; or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary.

78. Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.

All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOSH. S. HENSHAW, Sec'y.

79. Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty sixty or ninety days from date, to the Treasurer of the company.

By order of the Board of Trustees.

JOSH. S. HENSHAW.

80. Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees.

HENRY S. HUDSON, Sec'y.

San Francisco, Nov. 8, 1861.

Office Sierra Silver Mining Company.—At the Annual Meeting of the Stockholders, held Monday evening, December 9th, 1861, the following gentlemen were elected Trustees to serve for the ensuing year: H. Culver, Daniel Norcross, F. D. Conroy, Jason Clapp, Calvin Taylor, R. R. Noble, T. J. Farber, Isaac Tabor, E. Baker, Henry Palmer.

DANIEL NORCROSS, Sec'y. S. S. M. Co.

81. At a meeting of the Board of Trustees, held Thursday evening, Dec. 12, 1861, the following officers were elected to serve for the ensuing year.

F. D. CONROY, President.

W. H. CULVER, Treasurer.

DANIEL NORCROSS, Secretary.

D. NORCROSS, Sec'y.

82. At a meeting of the Board of Trustees, held Thursday evening, Dec. 12, 1861, an assessment of \$1 per share was levied, payable at the office of the Secretary.

D. NORCROSS, Sec'y.

144 Sacramento street.

Notice.—The annual meeting of the Charles Canby mining company, will be held at the office of the company (H. Davidson's room, northeast corner of California and Montgomery street, San Francisco) on Friday, Dec. 27th, A. D. 1861, at 3 o'clock P. M. of that day, for the election of officers for the ensuing year, and transaction of such other business as may be presented. A punctual attendance of all stockholders is requested.

By order of the Board.

ALEX. FLY, President.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....JAN. 18, 1862.

The MINING AND SCIENTIFIC PRESS published is at 522 Merchant bet. Montgomery and Sansome sts., ly

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOGRAPHIC and ELECTROGRAPHIC Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstances have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

A Word to our Legislators.

We labor and have labored for several years, in trying to advance the interest of every miner, mechanic, manufacturer and agriculturist of the State. We publish a paper worthy of a large circulation,—the MINING AND SCIENTIFIC PRESS is especially devoted to the dissemination of useful knowledge. No number ever leaves our office but contains much valuable information, practical suggestions and descriptions of new inventions, matter interesting to the farmer, mechanic and miner.

Our success has been commensurate with our efforts; but

we are not willing to stop here; we wish to have every member of our present Legislature on our list of subscribers. It is due to themselves that they be placed in a right position, for if they truly have the interests of the people in view their acts will show it, and one of those acts will be to aid in the dissemination of useful knowledge.

We will next week send an agent (Mr. T. H. Loehr) to the Capital, to solicit the honorable members to become subscribers, and trust every member's name will soon grace our hooks as a subscriber, for the session at least, if not for years to come.

Our Law Makers.

In our estimation no man should ever be elevated to the position of a law maker for the people, unless he can claim to have proper qualifications. The proper requisites we hold to be an ordinary share of common sense, good business qualifications, and a mind positively void of any narrow or contracted notions. A Legislator's sole aim should be to serve the people; his time should be given to advance the interests of every branch of industry in our State; and special legislation should be an abomination in his sight. Our State is yet young, and its numerous growing interests need the special and fostering care of wise men.

Heretofore too much special legislation has been indulged in; too many members had "fish to fry," they kept their own interests in the foreground, while those of the people suffered. We sincerely trust this is not the case with the present body. We are assured by men who are presumed to know, that the present Legislature is indeed an exception, that many of its members are farmers, mechanics and miners—men of good frugal habits, who have the true welfare of the State at heart, and that in consequence a short session might be anticipated, and no recurrence had to the bane of former years—special legislation.

If these expectations are proved true, the people in California will indeed have cause for congratulation; a brighter day will have arrived and our future be prosperous.

The State Geological Survey.

Certain resolutions passed recently in the Legislature, show that all proceedings with reference to our geological surveys are for the time being stopped. Whether from sad reverses this State has recently suffered from, or other causes, this important and most needful subject is thus cut short at a moment's notice. We are told by sage legislators that no monies for that purpose will be appropriated! We have considerable faith in the wisdom and intelligence of our representatives, but we heartily deprecate this penny wise and pound foolish doctrine, in expending some \$10,000 in establishing this survey, which would be a credit to the State and to the gentlemen who have charge of the geological survey at this juncture. The good work thus begun by Prof. J. D. Whitney would indeed have been productive of that which the Pacific States are particularly in need of, that is, a population of 5,000,000, which could find ample employment in mineral and agricultural pursuits, in this State alone. It is true we have at this moment an impetus from the Atlantic States, who seek our peaceful shores as an asylum to evade a bitter and rebellious war at their homes. The most of such immigrants are at best adventurers, "whose lot lies not among us," but would sooner or later return to their old fire-sides.

What we desire and wish to secure by this survey is a concise, correct topographical and geological description, which would place before the capitalists of the Atlantic States and Europe our boundless mineral wealth, and thereby cause them to embark in profitable mining operations, which would in a measure atone for monthly shipments of nearly \$4,000,000, for needless or surplus merchandise.

We might write reams of paper full of the immense advantages that would arise from such a source as a geological survey of the Pacific coast. We know that California possesses sufficient means of raising the necessary outlays to prosecute this laudable object. Not only should they continue to encourage survey, but an institute for geological and mining purposes should at once be established at the expense of the State; and an entire new code of laws should be passed to regulate mines, companies, associations, etc., and of these we shall speak anon.

Physiology.

We are more than pleased with the perusal of a neat pamphlet laid upon our table, containing the introductory address delivered at the opening for the year 1862, of the medical department of the University of the Pacific, by our friend Dr. I. C. Lane, Prof. of Physiology.

The science of Physiology is both interesting and important. Its study is necessary to attain eminence in the practice of medicine and surgery, for it teaches the laws which govern the body in health. Through its instrumentality limbs which were once sacrificed by amputation, are now oftentimes preserved to the patient; its lights and aids has enabled surgery to assume a far more conservative type, then attained when its teachings were less understood.

Its study is undoubtedly often dry. It is beset with theories and hypotheses, and often will the student's enquiries be conducted

"Through dark and devious path of speculation wild."

Yet it teaches so many truths and is a branch of science so necessary that it has engaged and occupied the attention of the illustrious and learned of all ages. We are indeed sorry that we are not enabled to lay the whole production of the learned lecturer before our readers—our space forbids. We will have to content ourselves by giving one or two extracts.

In speaking of the fact that limbs at the present day are oftentimes saved to the patient by a knowledge of this science, he continues:

"And this circumstance, which is due to the physiological fact that bone, muscle, ligament, and even joints themselves, when destroyed, may in a great measure, be reproduced according to their original type, will prove of infinite good to humanity. The glories which have been won by the cutting and saw have passed; they are wholly eclipsed by the far greater triumphs already, and yet to be, won by the conservative chisel, and scalpel. The achievements of the modern surgeon in the preservation of diseased limbs, should be reckoned among the most splendid triumphs of our period, compared with which the eulogy which attached to the former methods of mutilation sink into insignificance."

On another page he pays the following beautiful and just tribute to the nation, which at the present day has attained the greatest advancement in its study; He says:

"Germany stands pre-eminently high in medical scholarship; and I am safe in saying that there we may find to-day, a greater number of devoted scholars engaged in solving the hitherto unexplained questions of physiology than in any other part of the world. The Teutonic character is eminently fitted for patient investigation. The German investigator can labor for weeks, or even months, in the examination of a single subject, never once becoming tired nor forsaking it, until he has thoroughly acquainted himself with every feature of the subject, and everything else that can have a bearing upon it. This method of investigation is difficult for the American student, accustomed as our people are to do everything with telegraphic velocity. Still, the Teutonic method is the proper one to lead to ultimate success, and it is to be hoped that it may be adopted more and more by the American scholar. A union of Teutonic patience with the practical element of our countrymen, would, if adopted in literary research, soon yield a rich harvest of scientific discovery."

A Sad Picture.

No pen can portray nor tongue describe the scene of devastation and ruin at present presented almost everywhere throughout the length and breadth of California. The mind of man is entirely incapable of conjecturing a picture equal to the reality.

The late floods have devastated our valleys from Oregon in the north to San Diego in the south. Whole towns, bridges, fences, farm houses, flocks, everything in fact, in many localities, denoting the existence of the habitation of man, has been swept away, and are things only to be remembered. In a day as it were the result of years of toil and energy of many of our people are taken from them; peniless and almost heart broken, they are now seeking shelter in the cities and elsewhere, among brethren more fortunate. What the result of this calamity will be time alone can tell. It is true many years may again elapse ere another similar overflow may occur; yet what has happened may happen again, and where is the heart remembering the floods and sufferings of the year 1862, that can gather sufficient courage to go on afresh with this uncertainty impending?

Thousands of our farmers will undoubtedly have to commence life anew, and we sincerely hope they have the energy left to do so with a will; we also trust that the accounts of the disasters are overruled, and that when the waters subside the loss will be found less than present appearances would indicate; such we hope will be the case, yet we must acknowledge from what we have seen during a recent trip to Sacramento City and back, our hope is faint. We fear the worst.

The scenes of destruction met with on every side are indeed heart rending. Happy indeed would we had occasion never presented itself for dwelling upon such a catastrophe.

Mining News.

In these days of floods and disasters, it is vain to look for mining items, those of our exchanges which have come to hand at all, never mention the subject. Many exchanges are missing entirely. We presume travel in every direction except by water is cut off for the present. Our correspondence usually received from the mountains every week has failed to come to hand, hence we are compelled to go to press without our usual quota of mining news, and like editors of papers everywhere at present will have to harp on the ruin and devastations of the floods, which is truly a prolific source for items but which we would gladly not touch on had we our usual quantity of mining news.

The Bearded Lady.

Of all the curiosities ever presented to our gaze, none deserve greater notice than this most curious phenomenon. Nature has many peculiar freaks, and this seems to be a case truly wonderful. How physiologists may account for such a strange sight we are at a loss to know.

The boy appears equally wonderful, being scarce eight years old, and sports as fine a beard as our most daintiest swells of twenty years, on Montgomery street. Our citizens are crowding the premises to see this interesting lady.

Removal of the Capital.

The question of a temporary removal of the capital from Sacramento to this city was finally disposed of on Monday last when the Assembly refused to reconsider their vote, by which, on Saturday they refused to adopt Senate's uncurrent resolution for a removal.

Whether the house acted wisely time will tell. If there should be no more verberations this winter, it would have been the cheaper plan to remain at Sacramento; but owing to the high stage of water in every river—to the wet condition of the soil everywhere; a heavy rain of twenty-four hours may again send down torrents, at least a sufficient addition to again immerse the capital. If this should be the case the action of the Assembly was unfortunate, but presuming that members acted unconsciously and were unable to divine what the future hath in store: we can certainly lay no blame at their doors for their action in the premises, and will have to wait for future developments to know whether their action was wise or otherwise.

"It never Rains but it Pours."

This saying is emphatically true the past winter in California; the phrase "gentle showers has become obsolete," if it had held true in regard to the sins and evil doings of a nation, as with things material, that copious use of water cleanseth, our State or nation might indeed hope to immerge soon in purity, and free from sin; for no winter within the recollection of our great grandfather has an equal amount of rain fallen in the same length of time. We had hoped a week or two back that the angry skies had exhausted themselves during November and December, and that January would be a proper time for people to dry themselves; but like its predecessors, January follows in their footsteps.

Whenever the rains do cease to pour down we will make a note of it. We find our wishes are of no avail in the matter.

Antiquities of California.

To the antiquarian nothing can be more interesting than these reminiscences collected from over one hundred and sixty authors, and snatched from the oblivion of the early records of those periods, after the authors, the actors in those scenes, have long since been gathered to their final rest.
